measures cross-sectional dispersion of per capita incomes across economies measured as the standard deviation of the logarithm of per capita incomes, given by σ. In general, positive values of β should reduce σ as well, but this need not necessarily happen if exogenous shocks alter the distribution of the error term $\mu_{i,t}$. Thus while β convergence measures the speed at which the poorer regions catch up with richer ones, σ measures inter-regional inequality in per capita incomes at a given point of time.

(b) Convergence of Incomes across Indian States

We estimate the β convergence coefficient from the following regression model:

$$1/T.\text{Log } [y_{it}/y_{i,t-T}] = a - [\text{Log } (y_{i,t-T}) (1 - e^{-\beta T}) (1/T) + Xi + U_i \quad ...(2)$$

where y_{it} refers to per capita SDP in the ith state at constant (1981) prices, $y_{i,t-T}$ denotes per capita SDP in the ith state in the beginning of the interval, Xi is the vector of other variables to control for variations in the steady state values of x_i^* and y_i^*, and T is the length of observation.

To measure dispersion in per capita SDP across states, the standard deviation of the log of per capita SDP in the states, σ, has been estimated for each of the years from 1960-61 to 1994-95.

Our analysis of convergence takes into account the 14 major states in the Indian union. These 14 major states account for 93 per cent of population and 91.5 per cent

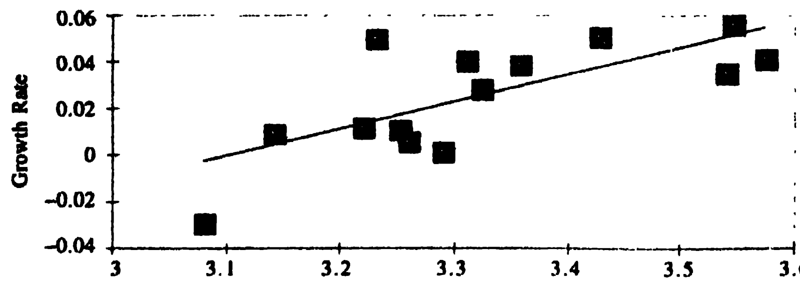
FIGURE 3: RELATIONSHIP BETWEEN LEVEL OF INCOMES AND GROWTH OF INCOMES ACROSS INDIAN STATES – 1990-94



across states though the states follow a broadly uniform approach and methodology. There are two arguments for using these figures. First, they are the only estimates available in a long time series. Second, a study by Das and Barua (1996) which estimated inequalities using both the series obtained almost identical results and therefore concluded, "...regional accounting variations are only minor from the viewpoint of inequality measure" (p 372).

It should also be noted that the concept of SDP only indicates the income originating in different states and does not represent total income accruing to them. Unfortunately, there are no estimates of net factor income accruing to a state from outside its boundaries, and therefore it is not possible to take these into account.

The estimated regressions using equation 2 (Table 1) reveal a number of interesting features of the interstate growth process in India since 1965. The most important finding is that per capita SDP in the states in India have tended to diverge rather than converge. These findings are contrary to the predictions of the neoclassical growth models and the empirical findings for cross sections of countries as well as different states within the US.[2] The basic equations regressing Log $(y_{it}/y_{i,t-T})$ with Log $(y_{i,t-T})$ show significantly positive coefficients. Thus, growth of per capita SDP in the states in India is positively related to their initial levels. In other words, states with initially high per capita SDP tended to grow faster than those with lower per capita SDP. The equation was estimated for various sub-periods beginning 1965 and ending in 1994-95. The strong positive relationship between growth rate and initial level of incomes holds true until the period 1980-95. In 1985-94, the relationship is not significant, but within it is significant in 1990-94 after economic liberalisation measures were introduced. The scatter diagram plotting growth rates of per capita SDP over the period 1965-94 against per capita SDP in 1965 clearly brings out the strong positive association between the two variables (Figures 1 to 3). The growth of incomes shows a positive slope from the initial level of incomes during both 1965-94 and 1975-94. After the introduction of economic liberalisation, the greater market initiative seems to have strengthened this positive relationship as may be seen from the steep increase in the positive slope during 1990-94 (Figure 3).

These estimates, however tend to be unstable because the effects of exogenous shocks are not controlled.[3] They may even have an omitted variable bias. Therefore, empirical studies on convergence include two additional variables, (i) share of primary sector income $(Ag_{i,t-T})$ to control exogenous shocks caused by fluctuations in agricultural output, and (ii) a standardised measure of sectoral composition (S_{it}) to minimise interstate differences in the steady state values x_i^* and y_i^*. The sectoral variable included in the equation is measured as:

$$S_{it} = \sum_{j=1}^{3} W_{ij,t-T} \cdot \log(y_{jt}/y_{j\,t-T}) \qquad \ldots(3)$$

where, $W_{ij,t-T}$ is the weight of sector j in state i's SDP at time t-T, and y_{jt} is the all-state average SDP in sector j in time t, expressed as a ratio of national population in time t.

Our analysis shows that there is a high degree of correlation (> 0.9) between the two variables in all the time periods considered here. Therefore, in the regressions, to ensure accuracy of the regression coefficients, we have separately included the two variables together with the initial per capita SDP levels in equations 2 and 3 respectively, for all of the time periods. However, the inclusion of these two variables does not alter the basic finding that per capita SDP across states in India has shown a positive trend over the years from 1965. The regression coefficient of $y_{i,t-T}$ is positive in each of the sub-periods even when these variables are included in the equation, though in the two sub-periods, 1980-94 and 1985-94, it is not significant. The estimates of β derived from these regression equations (Table 2) are consistently negative and significant in the first three periods showing a divergent trend in incomes over the years. The coefficient though has a negative sign and is not significant for the periods 1980-95 and 1985-95, but is significant again for 1990-94 after economic liberalisation was introduced. This underlines the importance of augmenting the quality of infrastructure in the poorer states to enable them to reap the gains from liberalisation.

This finding, which is contrary to the prediction of neoclassical growth theory casts doubts on the validity of the critical assumption of diminishing returns to reproducible capital. The positive association of growth rates with the initial level of incomes probably shows that, in an economy with large unutilised resources and a poor state of social and physical infrastructure, there will be increasing returns to reproducible capital in the initial stage of development followed by diminishing returns, resulting in an inverted U relationship between economic growth and inter-regional inequality as traditionally assumed [Kuznets 1955; Myrdal 1957 and Williamson 1969].

These findings contradict those of a recent study by Cashin and Sahay (1996) which concludes that there has been convergence in real per capita SDP across

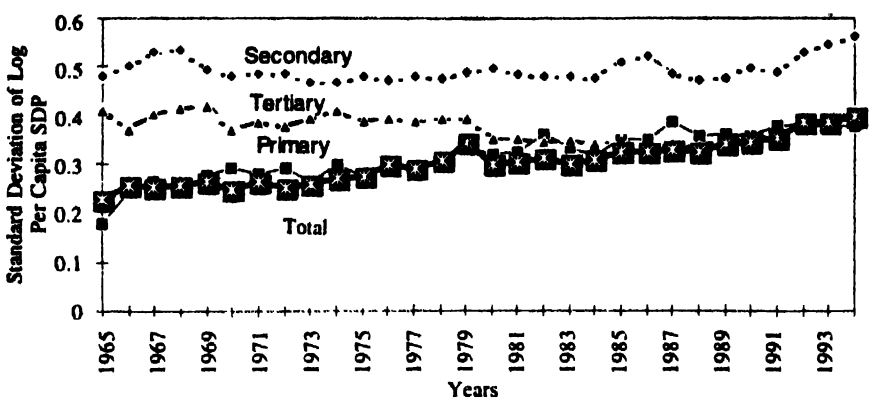
Figure 4: Interstate Dispersion in Per Capita SDP



states in India during the period 1961-91. A major reason for the differing results is that Cashin and Sahay include the special category hill states of Assam, Himachal Pradesh, Jammu and Kashmir, Manipur and Tripura as well as the union territory of Delhi. There are serious problems of comparability of income figures in these states and in some of them, much of the economic activity is determined by the government sector and the private sector hardly plays any significant role. It would be inappropriate to assume that production functions and therefore steady state values of incomes in these states would be identical to those of the major states in India. Therefore, for the sake of comparability we have taken only the 14 major states in the sample.

Secondly, the convergence coefficients estimated by Cashin and Sahay are not significant in the basic equations or in the equations with primary sector share. Even when an additional variable, the share of the manufacturing sector, is included the coefficient is not significant in two of the three sub-periods for which the equation was estimated. The authors then estimate a restricted combined regression with both agricultural sector and manufacturing sector shares included as independent variables in addition to the initial income levels, constraining the value of β to be identical across equations for various sub-periods.

The trend in the dispersion of per capita SDP across states over the years from 1965-66 to 1994-95 as measured by the standard deviation of per capita SDP (σ) in this article is quite consistent with the finding on divergence in the per capita SDP during this period noted earlier. Figure 4 presents the trends in σ estimated for per capita SDP in the states and also for primary, secondary and tertiary sectors. It is seen that the dispersion has shown a steady increase over the years from 0.2240 in 1965-66 to 0.3972 in 1994-95 (Table 3). The analysis shows that dispersion in the incomes of the primary sector has been the major source of dispersion in per capita SDP, particularly until 1990-91. The σ values for the primary sector increased from 0.177 in 1965-66 to 0.377 in 1991-92 and fluctuated around that value thereafter. In contrast, the σ value for the secondary sector fluctuated around 0.48 throughout the period until 1990, but increased sharply thereafter in response to the better performances of advanced states after economic liberalisation was introduced. With much of the tertiary sector being influenced by income from government services, the σ value for the sector does not show any consistent trend. This last finding is consistent with those of other studies analysing interstate disparities across states in India over varying time periods [Choudhury 1993, Das and Barua 1996].

III
Determinants of Growth

The examination of the reasons for divergence or lack of convergence calls for a more systematic analysis of the factors determining economic growth of states in the Indian federal economy. In this section, we explore the important determinants of growth of per capita SDP across Indian states.

Our analysis of convergence shows tha the initial income level which, to a larg extent reflects the initial capital stock i an important factor determining the growt rates. We can formulate the hypothesis o the relationship between the level of in comes and their growth rates dependin on whether the return to capital is assume to be diminishing, constant or increasing In a diminishing return to capital scenaric as assumed by neoclassical growth theo rists, the relationship will be negative. I the constant returns to capital assumed b Lucas (1988) and Rebello (1990), growt rate of per capita SDP is independent o the starting level. If increasing returns ar assumed, the relationship will be positive

We have estimated regressions to ex plain differences in the growth of pe capita SDP across states at different tim periods starting from 1965-94. Averag annual growth rates for six different tim periods (1965-94, 1970-94, 1975-94 1980-94, 1985-94, 1990-94), estimate by regressing the logarithm of per capit SDP on the time variable for each of th states, are regressed on plausible variable affecting the growth rates. The indepen dent variables included in the analysis ar the initial level of per capita SDP, huma capital stock, share of state governmen expenditure in SDP, private industria investment in the state and adoption o technological change in the agricultura sector. The literature emphasises the rol of human capital in determining economi growth [Romer 1990]. We have taken th literacy rate in the initial year to represen human capital stock and the variable fo relevant years is estimated by extrapolat ing the inter-census data.

The impact of government expenditur on the growth rate is estimated by takin the ratio of total state government expen diture to SDP (G/Y) averaged for the perio as the independent variable. However consistent and comparable data on govern ment expenditures for the states are avail able only from 1974-75, so the variabl has been used in the regressions fo

Table 3: Dispersion in Per Capita SDP across Indian States in Selected Years

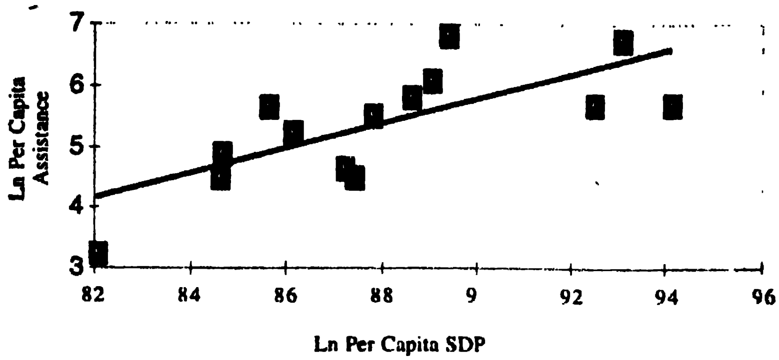
Figure 5: Relationship between Per Capita SDP and Per Capita Assistance by All India Financial Institutions across States – 1994-95



1975-94, 1980-94, 1985-94 and 1990-94. It is difficult to predict the sign of the coefficient of this variable. While government consumption expenditure is expected to retard growth due to distortionary effects of taxation, the investment expenditure is expected to improve private sector productivity, and hence accelerate growth. Also in the context of states, a significant part of a state's expenditure is financed through intergovernmental transfers, so the effect of expenditure on the economic growth of the state is indirect and may not be reflected in the regression. Finally, a sizeable proportion of current expenditures of the states includes spending on human capital which could have a positive result.[4]

An important factor determining the growth rate in a state is the private sector investment in manufacturing. There are no reliable data on private sector investments by states. We have taken the share of loans given by the all India financial institutions (AIFI) to SDP in different states as a proxy for private investments.

Economic growth in many states during the 1970s was driven by agricultural growth mainly due to the impact of the 'green revolution', which is a combination of the use of new varieties of seeds, application of chemical fertilisers and expansion in irrigation facilities. The states which adopted the new technologies grew faster than those which did not or could not. To capture the effect of adoption of new technology in the agricultural sector, the consumption of fertilisers per hectare of sown area (FERT) was employed as the variable. In the post-1980 period, much of the growth has been in the manufacturing and service sectors.

The regression estimates of the determinants of economic growth across states in India for the six time periods (Table 4) reveal a number of interesting features. First, in all three equations up to the starting period of 1980, starting income level had a positive and significant impact on economic growth. Thus, until 1980, these results confirm the inference about divergence in economic growth in the previous section. After 1980, the coefficient is positive but not significant.

Second, among other variables, the variable proxying private investment was the most important variable from the mid-1970s. Thus, much of the differences in growth rates among the states is explained by the differences in private investment levels, particularly since 1980.

Third, the literacy rate representing human capital shows a negative and significant coefficient in the first two equations (1965-94 and 1970-94), and is not significant in the next two (1975-94 and 1980-94). There appears to be a transition in this relation as the coefficient shows a significant positive effect on the growth rates in the periods, 1985-94 and 1990-94. The negative coefficient of literacy is surprising though it must be noted that in the initial years the green revolution-led growth was concentrated in the northern states such as Punjab and Haryana where the literacy rate was relatively low. The positive and significant effect in the periods since 1985 is consistent with the role of human resource development emphasised in the literature.

The regression coefficient of other two variables included in the equation, G/Y and FERT do not show a consistent pattern. G/Y has a positive sign but is not significant in any of the years. Interestingly, the regression coefficient of FERT is positive and significant at 10 per cent level only in the period beginning 1975 when the impact of the green revolution was maximum. Thus neither differences in the level of state government expenditure nor technological advances in the agricultural sector seem to have played a consistent or significant role in explaining the differences in the growth of per capita SDP across major states in India. It is possible that the level of fertiliser use per hectare was not a good proxy for new technology.

IV
Reasons for Divergence

(a) Private Investment and Public Expenditure

Thus, contrary to the predictions of neoclassical growth literature, per capita incomes across Indian states have shown divergence over the years and interstate inequalities in per capita incomes have shown a steady increase. This casts doubt on the validity of the basic assumption of diminishing returns to capital in the steady state growth models. The pattern of distribution of investments across states would give us insights into whether the return to capital shows diminishing returns or follows the traditional inverted U-shaped function in the Indian context. In part, the distribution of investments across states depends on the availability of infrastructure. While information on the stock of public capital in different states is not available, per capita government expenditure may perhaps serve as the best proxy. If so, the distribution of government expenditure across states and its relation-

FIGURE 6: RELATIONSHIP BETWEEN GOVERNMENT EXPENDITURE AND SDP ACROSS STATES – 1994-95

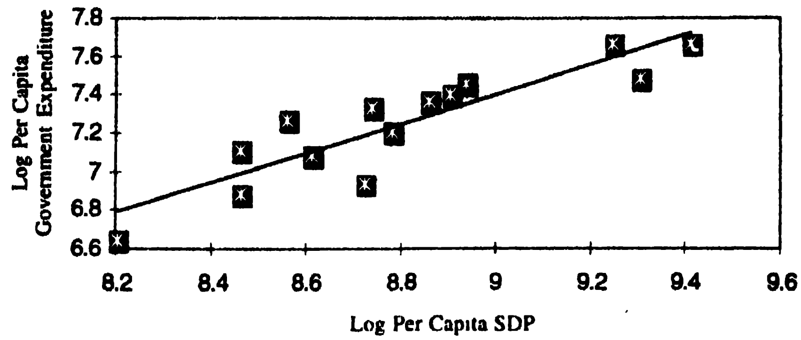

FIGURE 7: RELATIONSHIP BETWEEN LENDING BY ALL INDIA FINANCIAL INSTITUTIONS (AIFI) AND GOVERNMENT EXPENDITURE ACROSS STATES – 1994-95

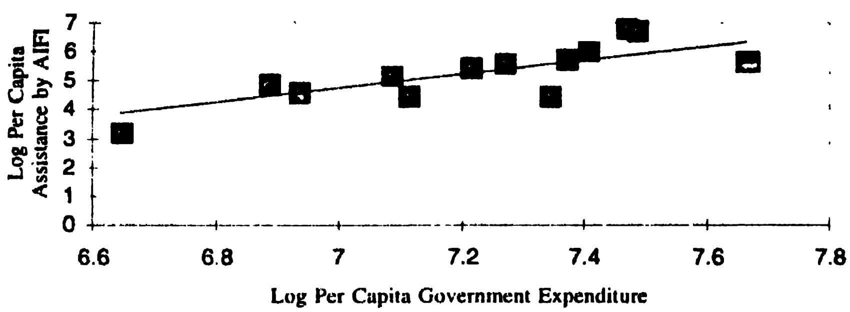

ship with private investment can help us understand the reasons for divergence in incomes across Indian states.

Table 5 presents the parameter estimates of equation regressing per capita loans given by AIFIs on per capita SDP across states for selected years. The results indicate that the flow of financial assistance is significantly higher in states having higher per capita SDP. In fact, the cross-section elasticity of loans given with respect to per capita SDP is much higher than unity in all the years for which regressions were estimated and this indicates that the rate of increase in financial assistance is faster than that of per capita SDP. In other words, the results indicate that the volume of private investment increases with per capita SDP, and the rate of increase is more than proportionate. Further, it is also seen that the elasticity has shown a steady increase, particularly since 1985. Thus, in 1994-95, for every 1 per cent additional per capita SDP, states obtained more than 2 per cent higher AIFI assistance which is clearly brought out in Figure 5. The higher flow of financial assistance to more affluent states, and the more than proportionate distribution of the assistance to them clearly shows that the distribution of private investment in India has been disproportionately in favour of the better off states. This gives indirect support to the proposition that in the Indian context, there has been increasing returns to capital, and that this explains the phenomenon of divergence of per capita SDP across states noted earlier.

What has been the role of state government expenditures in determining the growth patterns across states? Analysis in Section III showed that the share of government expenditure in SDP is not a significant variable in explaining differences in economic growth across states. However, the pattern of public expenditures can indirectly influence economic growth by influencing private investments. Public expenditure policy determines the availability of social and physical infrastructure which is an important factor in the location decisions for private investment. We have therefore regressed per capita assistance given by AIFIs on per capita government expenditures incurred by different states. The results presented in Table 5 show a positive and significant relationship. Thus per capita private investment as proxied by loans given by financial institutions are significantly influenced by per capita government expenditures. The cross-section elasticity of per capita loans by financial institutions with respect to per capita expenditures is more than two in all the years for which estimates were made and it is as high as three in 1990-91. Thus, states with higher per capita public expenditures had larger private investments, every 1 per cent higher public expenditures resulting in higher loan assistance by AIFI of more than 2 per cent (Figure 7).

(b) REGIONAL POLICIES

Interestingly, in spite of centralised planning for four and a half decades and the emphasis placed on balanced regional development in every plan, the distribution of private investment is clearly in favour of richer states. This may be explained in terms of institutional factors as well as public policies relating to the distribution of resources and physical and social infrastructure facilities in different

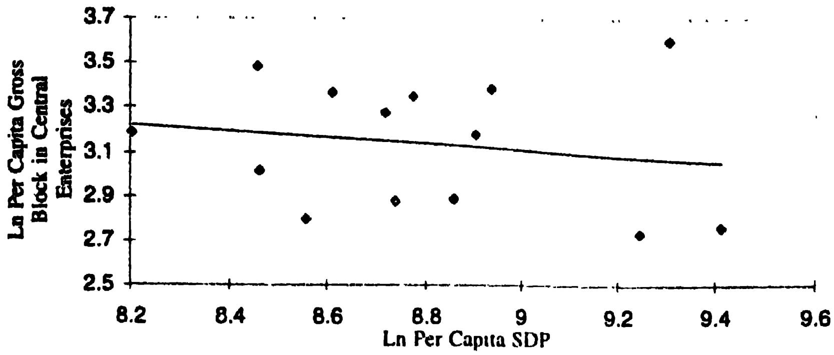
Figure: 8: Distribution of Investment (Gross Block) in Central Enterprises across States – 1993-94



states. Institutional factors determine the property rights and structure of incentives which in turn determine productivity in the economy. The system of tenurial relations in agriculture and a conducive environment for the operation of private enterprise in manufacturing and service sectors are important institutional determinants of investment spread. A favourable institutional environment results in establishment of two-way linkages between agriculture and industry, and states with strong two-way relationship will grow faster [Kalirajan and Shand 1996].

In a federal polity like India, regional policies and the distribution of central government expenditures have an important bearing on the pattern of regional growth both directly and through their effects on the distribution of private investment. Unfortunately, information on statewise distribution of central government expenditure is not available. Moreover, the distribution of the stock of central investment in public enterprises (gross block estimated at historical cost) does not follow any pattern. This shows that location of central public enterprises has not contributed much towards strengthening backward and forward linkages, contrary to the general impression.

Nor have the poorer states been able to reap full benefits from investments in industries like steel and coal which are predominantly located within their boundaries due to policies like freight equalisation. The transport subsidy given to equalise the prices of these basic inputs throughout the country has not only robbed the forward linkage benefits of locating these industries in poorer regions but has also led to allocative distortions.

(c) Distribution of State Government Expenditure

While the investments in central enterprises have not strengthened inter-sectoral linkages in poorer regions of the country, neither has the spread of infrastructure facilities created by state government spending helped to improve productivity in less developed states. The distribution of per capita expenditure analysed by regressing per capita expenditures with per capita SDP in a log-linear equation presented in Table 6 (Figure 7) shows that richer states do indeed have significantly higher per capita expenditures. The income elasticity of expenditures declined from 0.65 in 1975-76 to 0.41 in 1984-85, but increased to 0.62 in 1990-91 and further to 0.77 in 1994-95. Fiscal adjustment undertaken since 1991 seems to have accentuated inequalities in state per capita expenditures across state governments.

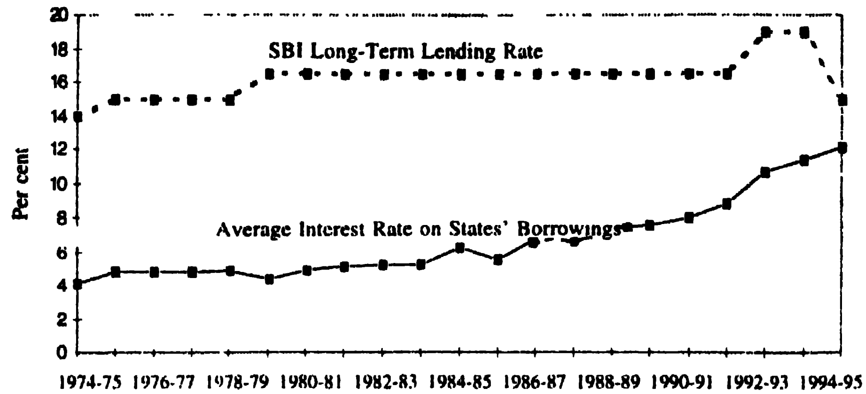
Figure 9: Interest Subsidy on States' Borrowings



(d) Intergovernmental Transfers and Horizontal Equity

Higher per capita expenditures in richer states are caused mainly by their high revenue capacity. Even when tax rates are identical, the states with higher per capita incomes collect higher per capita taxes and are thus able to provide higher standards of public services. In other words, the states with lower per capita incomes will have to levy taxes at higher rates in order to provide the standards of service available in more affluent states. Such an argument for redistributive transfers has been made on the grounds of horizontal equity [Boadway and Flatters 1982].

The above analysis shows that intergovernmental transfers in India, although they have had a significant redistributive impact, were nevertheless not adequate to enable the poorer states to provide equal levels of public services at given tax rates. Table 7 shows that central transfers have a significant redistributive impact as seen by the negative income elasticity coefficients. Also, the degree of redistribution was not very high in the early 1980s. It increased steadily until 1991-92, but declined thereafter, coinciding with the fiscal adjustment programme undertaken by the central government. Nevertheless, this redistribution achieved through intergovernmental transfers was not adequate to offset the fiscal disabilities of poorer states arising from their low revenue capacities [Rao 1997].

(e) Regressivity of Implicit Intergovernmental Transfers

A part of the problem lies in the inequitable transfer of resources due to implicit transfers. There are at least three important sources of such transfers: (i) interstate tax exportation, (ii) subsidised lending to the states from the central government and the banking system, and (iii) subsidised lending to the private sector by long-term refinancing institutions and assistance from the banking and financial institutions for priority sector activities. While the first two sources of implicit transfers affect the ability of different state governments to undertake expenditures, the third alters the rate of return and thereby, regional allocation of private investments.

Interstate tax exportation arises from the levy of origin-based cascading-type sales taxation along with the taxation of interstate sale of goods. The sales taxes levied by the states are predominantly on the basis of origin, at the stage of manufacture or import. The tax is levied on inputs, outputs and capital goods alike. As the tax is fully shifted forward due to the oligopolistic nature of the market, the levy of tax on interstate sales causes significant interstate tax exportation not only of the tax on the goods sold in interstate sales, but also of the cascaded taxes on inputs and capital goods. This results in the exportation of the tax burden from more affluent producing states to the consumers in poorer consuming states.

Non-availability of data on interstate trade makes it difficult to estimate interstate tax exportation accurately. However, analysis presented in Table 8 shows that in states with above average per capita income tax shares are higher than consumption shares (household consumption plus state government purchase of goods). Of course, the entire difference cannot be attributed to interstate tax exportation. A part of the difference may also be due to higher effective tax rates in more advanced states. By making alternative assumptions that the difference in effective rates (share of sales tax collections in total consumption) is partly due to legitimate variations in effective rates and partly due to interstate tax exportation, we have estimated the amount of interstate tax exportation. Thus, when it is assumed that 50 per cent of the difference is attributed to tax exportation, the more affluent states collected more than Rs 2,100 crore from the consumers in states with less than average per capita income. Thus, the richer states collected almost 13 per cent of their sales taxes from the residents of poorer states and the residents in poorer states paid 19 per cent of their sales tax payment to the richer states.

The second important source of implicit intergovernmental transfer arises from subsidised lending to the states. Loans from the central government alone comprise almost 68 per cent of states' liabilities, the bulk of which was given for plan purposes under the Gadgil formula. Market borrowings constitute another 22 per cent which is subscribed mainly by the banking system to fulfil the statutory liquidity ratio (SLR) requirements.[5] The extent and nature of intergovernmental transfers from this source depend upon the pattern of interstate allocation of these loans and

Table 9: Income Elasticity of Intergovernmental Transfers in India

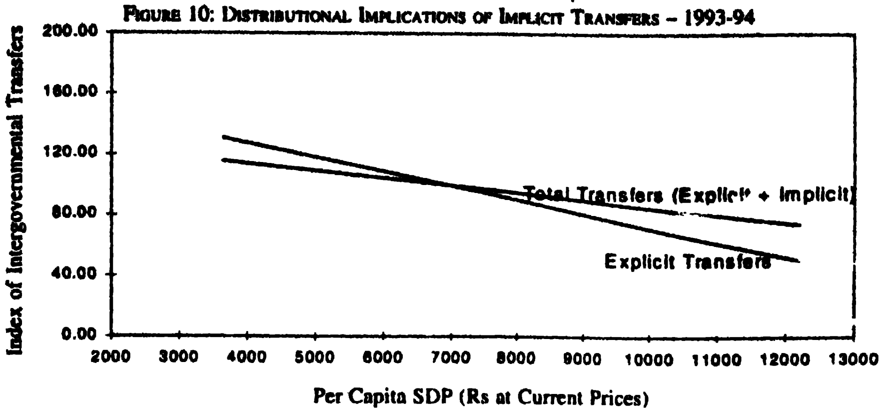
FIGURE 10: DISTRIBUTIONAL IMPLICATIONS OF IMPLICIT TRANSFERS – 1993-94



difference between the interest rate charged and the market rate of interest. Although in recent years there has been a significant increase in the rates of interest on states' borrowings, as may be seen from Figure 9, they still remain significantly below the market rate. In addition to these low average rates of interest (which are partly due to the periodic rescheduling of loans on the recommendation of the Finance Commissions), the central government also writes off loans from time to time.

Table 8 presents the distribution of per capita intergovernmental transfers due to subsidised lending to the states. Clearly, per capita transfers in high income states were higher than both middle and low income states. In 1993-94 the average per capita transfer received by the low income states was almost 18 per cent lower than that of the high income states. The difference was greatest in 1990-91 when the per capita transfers received by the low income states were 43 per cent lower.

The regressive nature of the implicit transfers due to states' subsidised borrowing from the central government and the banking system is brought out in the cross-section income elasticities presented in Table 9. The progressivity of explicit central transfers is brought out by the negative and significant elasticity coefficients throughout the period from 1981-82. In contrast, elasticity coefficients of implicit transfers had positive and significant coefficients right through the period indicating the regressive nature of these transfers. When implicit transfers are added to the explicit transfers, the progressivity of the transfer system is significantly reduced. Although the coefficients are negative, the absolute value of the coefficient is substantially reduced and the coefficients are not significant in most of the years.

Figure 10 brings out the effect of implicit transfers due to interstate tax exportation and subsidised lending to states in 1994. It is clear that the progressive impact of the intergovernmental transfer system is considerably reduced when the effects of these two are taken into account.

The two sources of implicit transfers discussed above affect the ability of the states to raise revenues and thereby the standards of social and economic services provided by them. In contrast, subsidised lending by the banking system and refinancing facilities provided by the AIFIs at subsidised rates to the private sector affect interstate resource transfers by altering the pattern of private investments.

Table 10 presents the distribution of priority sector credit and the financial assistance given by the AIFIs. The distributions of both sources of lending are disproportionately in favour of high income states. In the aggregate, these states, with just about 19 per cent of population, received 35 per cent of priority sector lending given to agriculture, small enterprises and exports. Their share of assistance from AIFIs was 43 per cent. In contrast, the low income states with almost 44 per cent of population received about 15 per cent of priority credit and 22 per cent of assistance from AIFIs. Thus the distribution of subsidised credit by the banking system and AIFIs has conferred disproportionate benefits on more advanced states.

V

Concluding Remarks

Our analysis shows that pattern of economic growth in India since the mid-1960s does not conform to the predictions of neo-classical growth theory. Per capita incomes across states over the period have shown divergence, and interstate disparities have been accentuated. The increases in divergence and dispersion have been much sharper in the initial years of liberalisation.

The analysis of the determinants of differences in growth rates among states confirms the divergence. The states with high initial levels of incomes grew faster than those with lower incomes leading to divergence in per capita incomes over time. It is also seen that the pattern of private investment is a major determinant

of economic growth. Human capital variable represented by literacy rate also is a significant determinant since the 1980s.

The regional pattern of investment allocation in any country depends upon resources, institutions and policies. Our analysis shows that social and economic infrastructure as represented by public expenditures has a critical role in determining interstate allocation of private investment. The divergence in growth rates thus, is largely explained by the skewed distribution of public expenditures causing larger flows of investments to more affluent regions in the country.

While the regional policies of central and state governments and public expenditure policies of the state governments play important roles in ensuring a balanced spread of infrastructure, the distribution of central investments in public enterprises does not show any favourable bias towards less developed states. At the same time, per capita public expenditure is found to be significantly higher in states with higher per capita incomes.

The significant positive association between per capita expenditures and per capita SDP brings to the fore the role of intergovernmental transfers in equalising the standards of social and economic services. While the phenomenon has to be partly attributed to the inability of the formal intergovernmental transfer mechanism to adequately offset the fiscal disabilities of poorer states, it must be noted that the informal channels of transfer too have played an important role, both by augmenting the revenues of relatively better off states and in channelling larger flow of investments to them. In this paper, we have identified three major sources of such implicit transfers. First, the prevailing system of sales taxation has facilitated the richer states to export a significant portion of their tax burden to the residents of poorer states. Second, subsidised lending to the states from central government as well as from the banking system has led to regressive intergovernmental transfers. Finally, subsidised lending by the banks for financing priority credit and refinancing facilities given by AIFIs have helped the richer states to gain greater access to investible funds at subsidised rates.

Our analysis has shown that the divergence in per capita incomes has increased, particularly since 1991, when economic liberalisation measures were initiated. This is not surprising because, with liberalisation of industrial policy, the flow of private investment has been mainly based on the relative rates of return on capital in different states. In this scenario, the more advanced states with relatively better infrastructure, trained human resources and accessibility to markets have been able to exploit the opportunities better than the backward states.

The study offers important lessons for development strategy. Unless significant affirmative measures are taken to correct imbalances in the spread of infrastructure through regional policies and intergovernmental transfers, divergence in incomes across states will continue to widen with both economic and political ramifications. There is also an urgent need to rationalise the tax system to minimise free-riding through exportation of the tax burden to non-residents. It is also important to understand properly the implications of and implicit transfers involved in subsidised lending to state governments, and the intergovernmental transfer mechanism should be designed to take account of these implicit transfers.

Notes

1 Breton (1996) argues that competitive equality and cost-benefit appropriability of jurisdictions are important contributory factors for the stability of horizontal intergovernmental competition.

2 For a comprehensive review of these studies see, Barro and Sala-i-Martin 1995 (Chs 10 and 11).

3 The conditional convergence hypothesis assumes a single steady state equilibrium. But, as discussed by Galor (1996), an economic system may be characterised by multiple steady state equilibria and may thus lead to 'club convergence' even in neoclassical growth models that exhibit diminishing marginal productivity of capital and constant returns to scale. A testing of club convergence hypothesis with these data will be attempted in a subsequent study.

4 We have also estimated regressions by employing the ratio of expenditures on social and economic services to SDP, and the ratio of capital expenditure to SDP. However, as these equations did not provide any additional insights, they are not reported here.

5 At present, the SLR stipulation requires the commercial banks to keep 25 per cent of their demand and time liabilities in eligible assets like central and state government bonds. Financial sector reforms brought down the SLR from 38.5 per cent in 1991-92 to 25 per cent in 1996-97.

Science, Knowledge and Society

Sundar Sarukkai

THERE are many issues, some convergent and others divergent, in the stand taken in the introduction and two articles by Sokol and Meera Nanda (*EPW*, April 18, 1998). As the introduction makes explicit, this collection is aimed at "initiating a critical reassessment of the culturalist critiques of modern science among Indian intellectuals". These three articles take a strong position against relativist epistemologies and in favour of scientific epistemology. The target of these attacks is the postmodern discourse. Making 'Sokol's affair' the catalytic point, they condemn the postmodern and postcolonial discourse by stating, "if they can be made to support a purely nonsensical thesis, one cannot but wonder how sound they are..." and also "to wonder, at the very minimum, if these theories are not missing something important about the nature of scientific knowledge?" (Nanda p 919).

Their arguments also go beyond being merely a critique of postmodernism. Both Sokol (1998) and Nanda (1998) would like to prioritise scientific knowledge as opposed to other knowledge systems, primarily in order to liberate the 'oppressed' in India (and presumably in other societies) and also to guard societies against 'fascism' which apparently arises in societies not sufficiently 'scientific' in nature. Of course, this tendency to valorise science as an agent of emancipation is nothing new, and many scientists and commentators of science have long held this position. Sokol's and Nanda's responses differ in their epistemological and ideological leanings towards authentic scientific knowledge and the belief in the Left as an agent of emancipation of the oppressed.

Although Sokol's concern is against relativism it is also directed against the intellectual trend in American universities and the American Left. I shall not discuss his article in detail like I shall do with Nanda's but only point out that too much has been made of too little as far as his 'affair' is concerned. Primarily, the fact that he managed to publish what he considers a fraudulent piece which extensively used the language and style of postmodernism has been seen as an indictment of postmodernism itself. The flaws in making such a conclusion are very clear, at least for those who do not have ideological positions at stake.

Even in scientific literature, there have been many examples of fraudulent papers (and many times papers filled with mistakes but which get published because they conform to the received discourse), which have been published. Most times these papers get published for the same reasons which made the editors of *Social Text* publish Sokol. But unlike him and his friends nobody would like to claim that these cases prove the duplicity of the discourse itself. And frankly, if you place his piece within the tradition of postmodernism there is nothing to even raise a gasp about. For what does it matter if Sokol thought he was pulling a fast one – his text transcended his intentions the moment it was brought into the public domain. As an author of that piece, he has no copyright over its meanings including that of 'fraudulence'.

Sokol seems to believe that 'sloppy thinking' which does not distinguish 'truth' and 'claims of truth' lies at the root of the confused postmodernist notions of truth. "What I'm saying is that it's crucial to distinguish between the concept of 'truth' and the concept of 'claim of truth'..." (Sokol 916). He believes that it is this confusion which pervades all alternate theories of truth. I find it hard to believe that Sokol does not realise that it is exactly this distinction which is the bone of contention: How do 'claims of truth' become 'truth'? Science claims to have a methodology which makes this transition possible. The critique of science, rephrased for Sokol, is merely the questioning of the primacy of this particular methodology. There seems to be no 'obvious' way to believe that a truth which has been established from a claim of truth can only be done within the scientific enterprise. Most human activities always involve a similar kind of adjudication.

On the other hand, Nanda's thoughtful and coherent paper situates the problem in the Indian context, primarily for two reasons: one, the project of emancipation through the agency of the Left and two, her conviction that alternative epistemologies tend to consolidate Hindu culturalism which she sees as a fascist movement. To stake these positions she argues forcefully for the primacy of scientific knowledge and method. Her elaborate defence of this position allows me to intervene at many places. I shall focus on some, in my view, facile categories which allow her to establish her claims.

Let me summarise my own position here. Nanda would like to base her arguments against relativism through recourse to scientific epistemology. But nowhere in her paper does she succeed in 'proving' that alternative epistemologies are untenable; she merely keeps reiterating her belief that such alternative epistemologies do not fit into her political and personal agenda. The arguments against alternative epistemologies (especially those in 'opposition' or distanced from the scientific one) are untenable if based on epistemological arguments, *per se*. The reasons have to do with confusing domains of applicability, conflating different 'objects' of discourse, insufficient understanding of the link between epistemology and social behaviour, incoherent positions of epistemology and action and so on. The state of the Left and their claims as agents of emancipation, the resurgence of Hindu fascism, etc, are not problems in the epistemological domain. Linking them with epistemological concerns is a project which stretches its resources beyond their capacity.

I do not believe that comparison of different 'epistemologies' is possible in an 'objective' way. There is a need for a qualitative shift from *posteriori* epistemologies to a priori categories of social and individual existence. Traditional and alternative systems of knowledge are just that – systems and not stray statements taken out of their systemic context.[1] To imply, as Nanda does, that explanation from science regarding crops is more desirable than the explanation of a peasant woman (920) is to be blind to the notion of lived experience. Even seen through categories of science, lived experience is empirical, perhaps more empirical than much of science. But this does not imply that science and tradition have to be mutually exclusive strategies – when they both shed their ideological masks, they can grow together.

We do not live by knowledge alone. Of course, one may tend to look at every act of ours through an epistemological prism but this is exactly the reason why there is so much posturing on both sides. Staking for the authenticity of lived experi-

ence should not be seen entirely as an epistemological project.

Domain Problem

There are many overarching concepts in Nanda's paper which by their very unification of diverse elements make possible her conclusions. Let me list some of them: science, India, Left, truth, knowledge, modernisation, oppressed, culture, reality, fascism, and so on. Many of these 'unified concepts' are predicated on her homogeneous view of 'science', 'scientific knowledge', 'scientific temper', and so on. I am perfectly willing to buy the argument, if she holds it, that science stands for sciences and the unification of plural sciences into one 'science' is to facilitate communication and removing needless qualification. I am in much sympathy with this communication praxis but am afraid that this first step already hides structures which will question the conclusions reached later. If these structures are exposed at every step, I see no easy way out for her as far as her conclusions are concerned.

To expose the multiplicity inherent in science, I shall first address the 'domain problem'. I would like to view this in two parts: domain of application and domain of action. Epistemology is concerned with the domain of application, that is the set of statements over which epistemological structures can be brought to bear. This does not constitute 'science' in full. There is also a domain of action where science converts epistemological statements into principles and agencies of action. Many times it is not easy to find a simple link between these two domains for the reason that technology plays the surrogate to science in this programme. Neglecting to not only mention technology but also not explicate it is part of Nanda's view of science as an homogeneous entity whose different activities are linked together through its own canons. One does not need a sociology of science to realise one cannot hold such a nice picture of science.

Let us see the problem of conflating domains in Nanda's project. Her basic view of science is this: it is a project which allows us to generate a set of culturally neutral, valid statements about the world. Nanda's comment about its "ability to tell us something that is valid across cultures" (916), is merely an assertion. The statements of science tell us something about particular things. These things, as we well know, belong to the 'natural' world, in the sense that they are mute towards what is said about them I am sure Nanda appreciates this well known point but her disinclination to qualify this allows her to validate across domains which are not part of the scientific project. Scientific epistemology is about nature and the role it would like to play in understanding individual and social activity of humans should be carefully examined before assuming its validity in these domains. As we know quite well, epistemological structures cannot be easily carried over from one incompatible domain to another.

Consider these quotes from Nanda: "scientific knowledge...served as a vanatage point for critical evaluation of our social context" (916) and "the necessity of a scientific world view for the advancement of equality and justice for all in our country" (919). How does an epistemology related to 'things' get transformed into an epistemology of social action unless society and its human constituents are to be seen as 'things'? Even granted that, at this level of approxi mation, one could 'objectify' society an its peoples and generate some kind o scientific knowledge about them and thei social interactions, how does it allow fo the link to social change which is not product of 'thing', *per se*. Things do no act. That is, it is not epistemology whicl is the ordering force for social relation and cause for its inequalities. This is most important point which she neglect to understand.

The domain problem is importan because Nanda continuously reject traditional systems of knowledge becaus they do not fit the scientific criteria fo knowledge. This too is well known - science functions by exclusivity, b definition. As has happened innumerabl times, non-science has been kept out o science but this does not imply a negatio of epistemology. Let me clarify further

"If there is anything that is absolutise by scientific reasoning, which the critic

ridicule as big R-Reason, it is this demand for a scrutiny-by-doubt, a demand that we subject our beliefs to tests not under the control of these same beliefs" (Nanda 918). This is surely a tall claim, even for scientific reasoning. Let us say I believe in electrons. How do I subject this belief to 'tests not under the control of these same beliefs'? I don't know how, nor do the scientists. To test my belief in the existence of electron, I begin with concepts like charge, mass, etc. Then I design experiments whose outputs I interpret within the space of these beliefs I hold about the electron. This is the case with a majority of scientific claims about the things. Beliefs do not get justified in a vacuum. They are intrinsically linked with the nature of beliefs itself.

This insensitivity to the domain of application continues in her paper. "...believe that dispassionate striving for the ideal of objective truth ... is the best epistemology for the left" (919). Down the line, she places 'cultural introspection' implicitly on par with scientific methodology as a way to combat that "rising cultural and religious chauvinism" (919). Relentlessly she continues with the same mistake. Science is "capable of empirically testing the effects of social bias" and scientific knowledge puts "increasing distance between its theories and the social context from which they admittedly arise" (919), and so on. In the closing parts of her paper she compounds the mistake irretrievably. "The historic role of scientific ideas has been to replace metaphysics with physics, to demolish the closed, hierarchical world and reveal the pre-social equality of all human beings, and to free the mind from fear of gods and djinns" (922). Phew! This really puts the pressure on science and seeks a status to science which it itself is fast recognising as difficult to attain. It is really being more Roman than the Romans themselves or more appropriately in the context of Nanda's attack on the Indian intellectuals, more American than...

The problem with the last statement exemplifies the problem with her other statements: "Replaces metaphysics with physics" – a non-starter, especially in the context of modern physics. What science effectively does is to be blind to the shadow of metaphysics clinging to the statements in it. Everything in physics is metaphysics – causality, properties, laws, relations, qualia, states, etc. What she views as replacement is what some of us would consider as forced exclusion.

At a micro level this also means that since science, in her view, will demolish caste structures then the practitioners of science would first and at an individual level not follow caste hierarchies. At a macro level science as a tool for emancipation implies that scientists are agents of emancipation or at least lead their lives according to the tenets of science. I do not even have to argue against this absurd view. Scientists, for long and surely in the future, make a distinction between *doing science* and *living science*. That is because they understand something which Nanda apparently does not. Domains of applicability are very different. Their families and children are not objects which become mathematical symbols ready for manipulation nor can they find universal laws which their spouses and colleagues obey. Not that they expect this! Just because one believes in the efficacy of scientific methodology which allows us to make claims about electrons does not imply in the efficacy of these methodologies to make claims about Ram or Rahim.

Now if Nanda wants to claim that although the transformation of scientific methodology from domain of objects into domain of people is done at a macro and not individual level, then she has to explain how such a thing happens across a sea of incompatibility. Of course, I do accept that science has had an impact on society and sometimes for social emancipation. This is possible because science could function as an imposed ideology and for reasons which are not necessarily scientific in character. More importantly, Nanda's view neglects the fact that the action of science on societies is not a singular cause. Changes in societies are a product of many causes, some which have to do with science, technology and modernisation. There are many other factors besides these.

There is a way in which science has manifested itself in society and culture. This is through technology. It is not a surprise that Nanda ignores technology. This is not surprising because people who have an ideological stake in creating a particular image of science have routinely done this. The most charitable view one can take here is that Nanda means science and technology when she refers to science. But in this conflation of meanings, there is the genesis of the problem, that which illuminates her ideological perspective.

There is a good reason why technology is not explicitly invoked by those who talk only in terms of science. It is because technology, many if not most times, does not pay obeisance to the scientific canons of behaviour. It plays to rational, scientific epistemology. It is technology which predominantly mediates between scientific epistemology and societies. But emphasising technology as an agent of science will cause unnecessary problems for Nanda's conclusions. I do not intend to take the view that technology is not based on scientific knowledge. But I also do not intend to take the simplistic view that technology is a direct by-product of scientific epistemology. Not only have technologies, in their own right, contributed to the furtherance of scientific knowledge but also have not adhered to the 'scientific temper' in their own formations. Technologies are messy. Many times they are not products of rational step-by-step process. They are also not amenable to control like scientific objects, numbers, functions, and so on.

Subsuming technology within science is to silence its truancy in order to exhibit science as a rational method. Even if one acknowledges technology to be 'quasi-science' there still remains the question of agency. How does technology stand for science in forming social beliefs? Is there a nice picture for us here? Science is objective and rational, technology is a by-product of science and so is objective and rational; technology brings about change in societies which therefore make societies objective and rational. Some argument like this underlies the belief that scientific epistemology can entail social change. But how is this link possible?

Let me grant, keeping my earlier scepticism aside, that technology does embody scientific objectivity and rationality. Now how does one transform the objective and the rational present inside machines and products to objectivity and rationality in individual and societies? How does one transfer methodologies and world views through commodities of use? How is it that we become more caste conscious, or see the evils of sati (or even become a leftist) through technology or through canons of science as applied to objects like electrons? How can Nanda argue for their link and the possibility of transmission of 'scientific values' while being fully within the scientific discourse?

Nanda is betrayed by science itself, that which she so much wants to save from other predators. Science cannot handle the burden put on it by her. Science does not have to make these strong claims. Caste structures are not demolished by each one of us taking an oath to have the scientific temper. That is not only to reduce sociology and 'politicology' to a few methodological do's and don'ts but also to reduce the rich

tapestry of science to an outdated scientific temper.

Scientific and Cultural Chauvinism

"The need for a critical introspection was never more acute than it is today, when we are faced with the rising cultural and religious chauvinism" (Nanda, 919). Nanda is clear about the need to come together, at least the leftists, in the defence of science, in order to combat the rising cultural chauvinism. Sokol's article, the *EPW* theme note and Nanda's paper continuously stress the point that post-modernism has not only contributed to this disturbing trend but also has helped to validate cultural and religious chauvinism.

There is something worrisome in this position. That somehow in the cultural dynamics of our societies, cultural and postmodernist discourses have suddenly been formed almost as if in a vacuum. There are many reasons to be wary of such a simplistic 'Big Bang Theory' of postmodernism and cultural chauvinism. I shall mention only one reason centrally relevant to this claim: if before the postmodernists and postcolonialists (early 1980s according to Nanda) there was an acceptance of a general spirit of scientific temper, at least by the intellectuals, why was there a sudden shift voiced by people like Nandy, Vandana Shiva, and so on? The easiest answer is that they followed the current fad at that time in the west and many Indian intellectuals jumped on the rolling wagon. But this is purely an argument of denigration, whether in part true or not. To understand the sudden shift in India (and earlier among their western counterparts) is to understand scientific chauvinism and see cultural chauvinism as a response to it.

This is the heart of the problem. Scientific discourse has been reduced to very convenient, neatly packaged epistemological sachets with elements like objectivity, rationality, and so on. With state backing, especially following the Nehruvian vision, these catchwords have developed their own momentum and threaten to intrude into all areas of the society. This would even have been welcome if not for their highly exclusivist strategy. The worrisome part in this is that the exclusivity is not a by-product of the scientific methodology but arises from personal or group agendas. Already the nature of the scientific discourse is highly exclusivist and to compound it individuals and groups appropriate the catch-terms of this discourse for their own ideological ends. It is not at all difficult to see if this is so: an ethnographic study of the scientific community throughout the world, including India, would generate multiple meanings for science, objectivity, rationality, and so on! Science coupled with an ideological fervour reminiscent of Nanda's, has built a new Indian society and in building this, through primacy of neatly packaged epistemological picture, has attempted to keep all non-science out of its purview. By reducing all epistemologies into one epistemology (that of science), it has negated the epistemological foundations of other systems of knowledge.[2]

Thus cultural chauvinism did not arise in a vacuum where a set of people aping the west or given to anti-scientific temper (real temper, this!) suddenly decided to revolt against the epistemology inherent in science. Cultural chauvinism is a direct response to scientific chauvinism. Nanda's language in her paper is a good example of this chauvinism. To say that not only is there a cohesive epistemology of science but also that it is a privileged one and adding to it statements like 'against gods and djinns...' is an extreme example of chauvinism. Not to expect a response to this chauvinism would not be scientific at all!

There is another historical route towards addressing the concerns of chauvinism and their 'link' with postmodernism and/ or denial of the primacy of scientific epistemology. This is to do with the fact that fascism has been prevalent in many forms in our modern societies, much before postmodernism came on the scene. In fact, many fascist societies were strong scientific and technological societies. It may even be argued that science and technology has contributed much more to the growth of fascist societies than any other ideological system. It is also not an accident that the communists have used science and technology as an important component of their ideology, for there is something intrinsic in science and technology which makes it very user-friendly for fascism, especially since the notion of 'control' lies at the heart of scientific epistemology. It is very simplistic to make a one-to-one connection between postmodernism and fascism especially while claiming that scientific temper will help eradicate it without first seeing what has been obvious to the whole world: that fascist communities have had very strong links with science and technology.

Nanda also makes a fundamental mistake in conflating issues of religion and science. I shall not go into this debate in detail except to make three short points. (1) As mentioned before, scientists themselves (and many of them good scientists at that) have learnt to differentiate between being religious and being scientific because they understand, however vaguely, boundaries of the discourse and domains of application.

(2) The link between science and religious chauvinism is once again at odds with each other. Fascism has routinely manifested itself in societies which are strongly scientific in character as well as in societies which are strongly religious in character. This means that to understand fascism is to understand ideology and not epistemology.

(3) The link between postmodernism and growth of religious chauvinism is completely misplaced, especially in the Indian context. There has been an increasing growth of religiosity, which of course is not equivalent with religious chauvinism, during the last decade or so. At least in parts of the south, I do not see a link between this growth and the political or philosophical discourses in mainstream India. The reason for this growth is obviously multi-causal including the changing patterns of the families, changing economic and social values, and so on. The growth in religiosity is not a product of some kind of epistemological stand arising from the postmodern discourse. Although increasing religiosity may increase religious chauvinism, there are also a host of other reasons including the dynamics of growth of communities and the political voices which arise in such a growth. To ignore these complexities and to posit a solution through some kind of acceptance of scientific epistemology is not only naive but is by itself also fascist in nature! The growth of religiosity during the last decade is a strong argument that this is the lived response to all the products of modernisation and not an explicit reflection of postmodernity. Confusing religiosity with Hinduism or religious (or cultural) fascism is to make a serious category mistake.

In a section titled 'Modern Science without Apologies', Nanda argues against constructivist theories of scientific knowledge and also against the claim that there is no hierarchy among epistemological systems. What should be validly accepted as knowledge is the scientific one. As I argued in the last section it is precisely this lack of 'apology' in staking claims of legitimacy that creates and stimulates chauvinism of various kinds. It is important for science to be able to find a self-articulation of its boundaries of

discourse. There cannot be science without apology; especially in these days when science wants to have a say in all disciplines.

Why do Sokol, Nanda and a host of others target the postmodernist discourse? What is it within the voice of post-modernism that disturbs them so much that they take it seriously in order to dismiss it? I find it hard to understand that Sokol's 'proof' seriously impinges on the substantive nature of post-modernism. Nanda continuously attacks postmodernism and postcolonialism because she sees them primarily as questioning the primacy of scientific epistemology. In contrast, Sokol, Nanda and others of their kind would like all of us to accept the 'universal truths' of science and its story about the natural world. But it is not surprising that nowhere in her paper can Nanda show, in the scientifically rigorous manner which she privileges, that scientific epistemology and the story of reality as written by science are true independent of the epistemological system one is in.

Herein lies the mystery behind the fact that much has been written about the danger of relativism, especially to do with knowledge claims, but very little has been done to concretely 'prove' the 'superiority' of scientific epistemology by using science's own systems of justification. Unable to find the structures of justification which can justify their belief about the primacy of the scientific epistemology, the proponents of science take recourse to claims of fascism which relativism (and postmodernism in general) supposedly engenders. There is an important lesson which we should have learnt well from many previous debates between competing systems. This is that when one side charges the other with inciting fascism you know they have already lost the debate. This charge of fascism and anarchy has been the last attack when other 'reasonable' tools fail. All that Nanda does is to continuously insist that alternative epistemologies cannot be on par with scientific epistemology; that science has its own special methods to take care of removing subjective elements in it, and so on. But nowhere is it possible for her to exhibit convincingly within the scientific tradition or otherwise why we should take her insistence at face value. And at the end of her paper when she runs out of steam after repeating this same assertion, she resorts to a picture of science as saving us from 'gods and djinns' and post-modernism as leading to cultural fascism. I think the moment she restores to this charge she has lost her case.

But there is something substantial in her concern about the danger of proliferating systems of knowledge, all or many of which may be as valid as scientific knowledge. Science, in her view, seems to have the right epistemology and has a lesson for all of us about running our life or our society. She does not want to give equal weight to different knowledge systems – one which talks about ghosts and the other about electrons. Her concern about the constructivist theories of knowledge are also germane but her tone betrays her lack of constructive engagement with these positions. I think this question is still very open but all that I am convinced of is that it is not epistemologically possible to compare different epistemological systems. I also believe that she and Sokol are mistaken about the connection between post-modernism and science.

Is there any relevance of postmodernism to science? At the level of practice there is obviously very little postmodernism can contribute to science. But this has to do with the nature of discourse itself and does not reflect particularly on the postmodern discourse. Many scientists believe that philosophy of science, for example, has contributed little or nothing to progress in science. The central relevance of post-modernism towards understanding science lies in the fact that postmodernism makes us reflect on science not merely in terms of its own praxis but also in terms of discourse formation. Postmodernism is a means of opening up discourses and it is through this that its impact in understanding science will be seen. We can then situate the problem regarding scientific epistemology versus other epistemologies in a proper discursive structure.

The first fall out of doing this is an awareness that science is more than neatly packaged epistemology. You do not need social constructivists to tell you that progress in science has rarely worked on the basis of its idealised scientific epistemology, including ideas of rationality, and so on. More important, focusing on this idealised image of epistemology closes our vision to other important, perhaps equally important, structures which go to constitute science. Knowledge is understood as justified (true) belief. This prevalent view of knowledge makes comparing different epistemologies a genuine problem. Because justification is itself a normative term, different systems of justification only embody different norms. And the fight between the different systems of knowledge end up being quarrels about whose norms one should accept. At this level of argument the scientific realist like Nanda cannot stay within epistemology and still argue for the primacy of scientific knowledge. The argumentative point at which she cannot sustain this occurs the moment she invokes fascism to rebut the critics of science.

If science is not just epistemology what else is it? In fact I would aruge that even before epistemological questions arise, there are other structures which make justification possible. Prominent among this is the ontological structure. The ontology of science commits one to a plethora of entities, real and abstract, objects in the world and theoretical entities. Much of epistemology in science is intrinsically linked with an inherent ontology. Many, if not most, of these entities are not open to scientific epistemology in the way Nanda's arguments seem to imply. There is very little of the scientific temper which will make one believe in these entities. There is first a sphere of ontology which, many times, is pre-epistemological! This strong commitment to a particular kind of ontology distinguishes science from other activities, notably humanities. Acting as if epistemology is the foremost and mot important member of the scientific activity is to ignore a fundamental aspect of science.

There is yet another problem, even if one sticks to epistemology. It is a myth that scientific epistemology has to do entirely with objectivity, rationality, and so on. Look at the kinds of epistemological structures present in scientific epistemology. The justification for different kinds of beliefs manifest in different ways. For example, there can be foundationalist theories of knowledge whose assumptions are that there are a set of beliefs which do not have to be justified and on which other beliefs are based upon. There are also a priori and intuitionist theories of knowledge which are intrinsic to scientific epistemology. For example, the question about how we can have knowledge about abstract mathematical objects have been answered by saying that such knowledge is possible because we know intuitively about these objects. This position that the truths of mathematics are open to us (or at least to 'good' mathematicians) intuitively has been held by very prominent mathematicians like Godel, Hilbert and a host of others. Other kinds of intuitive knowledge have also been strongly privileged in scientific epistemology. But when one accepts these a priori and intuitive categories of knowing then one also has to allow for different kinds of intuitive knowing.

One immediate response, essentially in order to control the proliferation of intuitive knowledge, is to claim that even if one has intuitive knowledge it becomes a part of science only after it is open to verification, and so on. This is a picture which is only partly right. Many more intuitive truths may have to be jettisoned compared to others which have been incorporated into science. But this too is not as simple a conjecture. The case of mathematical truth, not open to verification other than self-consistency and obeying identity conditions, is a classic example. Equivalently, even in 'knowledge' claims about our lives there is always a tension between intuitive knowledge and its acceptance.

So, my main argument is that epistemology in science is not as simple and straightforward a creature as Nanda and Sokol make it out to be. This should be factored in any discussion of science especially when contrasting it to other systems of knowledge. There is a lesson in both the strong scientific position regarding the primacy of scientific knowledge and the sometimes muddled arguments of the social constructivists. This is a simple lesson: You cannot compare and hierarchise different systems of knowledge based on epistemology alone. This has repeatedly failed because you cannot be in one epistemological system which can address the different systems of knowledge and can thus help to prioritise and validate these systems. You always run into the problem of incompatibility and differing norms of justification. This does not mean that different claims of knowledge cannot be judged in a way which accommodates these different systems of knowing. All I am saying is that crowing about scientific epistemology is not going to do the required trick.

Reducing social interactions and beliefs to a set of epistemological statements also does disservice to the complexity of society. It is not epistemology or its agent that lies at the root of social problems. A host of factors, including economic mobility, urbanisation, power structures, institutionalisation, and so on, play leading roles in creating and sustaining various beliefs. The situation is quite analogous to that in science. The main difference being that in science beliefs are open to change depending on the development of theoretical and experimental sophistication. To believe that social beliefs do not change is to overlook the obvious. Social beliefs also work in similar ways; their time scale of change may be much longer but they are always open to change. And when they are not, it is not due to somebody holding an epistemologically inferior position but due to power structures which make individuals or groups continue to hold onto certain positions. So invoking epistemology and prioritising scientific epistemology is to shift the focus and thereby negate the possibility of action and emancipation. The fight against oppression of women and the oppressed classes is not to be done at the level of epistemology but at the level of demolishing existing power structures. It may be believed that power structures lie on a base of knowledge but this is to oversimplify the issue.

Conclusion

The three papers in *EPW* try to argue that postmodernism is essentially a flawed discourse and appeal to us to see the 'obvious' power of scientific epistemology. Nanda goes further and claims that postmodernism and postcolonialism generate and consolidate fascist tendencies in our society. She claims this by arguing against alternate epistemologies as on par with the scientific one and critiquing the social constructivist theories of knowledge. She also believes that a society which bases itself on scientific epistemology will eradicate oppression and irrational beliefs in gods and djinns. Her vision for our society seems to be that if we all accept the epistemology of science then our society will be a far better place to live in.

The flaws in these positions have been set out in detail. In particular, the problem of trying to use scientific methodology across inapplicable domains and the question concerning the link between scientific epistemology and social action were highlighted. I have also argued that there are no such neat pictures of epistemology available to us, including in science. Science is not a homogeneous creature. Epistemology is just one part of scientific activity. Science is also distinguished by an ontological domain which is also of importance in any cross-systemic understanding of knowledge systems.

Arguments regarding the superiority of one epistemological system over another without finding a common epistemological basis are doomed to failure. They invariably take recourse to ideological positions in order to uphold one epistemological system over another, like the repeated charge of fascism in Nanda's paper. To effectively understand this debate is to begin at the level of discourse formation, both for science and non-science. This will dilute the excessive importance given to epistemology. This will also allow for common points of agreement and disagreement. There is enough ammunition in such a discursive study to critique naive social constructivist positions even as it allows ways to enter the scientific discourse in order to loosen its hold on itself. This is possible only through postmodernism because as a discourse it is the one which has found voices to speak about discourses, including a self-reflectivity which is very important. Both Sokol and Nanda trivialise postmodernism, essentially equating it with certain strains of social constructivism, in order to re-stake their leftist agenda. All that they say could have been said from the vantage point of the leftist ideology without invoking the superiority of the scientific epistemology at all.

Notes

[I thank Dhanwanti Nayak for her critical response to this piece and for continued discussions on this subject.]

1 Unfortunately, almost all the examples given by Sokol and Nanda are statements taken out of their systemic context. Their arguments also use another technique: to choose the most exaggerated statements of a discourse to condemn the discourse itself. This is also a worrisome way of arguing Since their position is to show the 'emptiness' of postmodernism *vis-a-vis* science, we must look to see whether we would like to understand science only through hyperbolic statements. All discourses, including the scientific one, use hyperboles, metaphors and ample use of universal quantifiers. So one must tread with care when choosing certain provocative statements to pass a judgment on the discourse itself for it may rebound with as much ferocity.

2 Thanks to the inculcation of science and state support, the 'best' students in India, at least a disproportionate amount of them, have shifted to studying science subjects. The impact of this shift is felt by teachers in humanities today. Their constant refrain has been: 'we get so few good students in humanities'. Unfortunately for Nanda, even though the quantum of scientific temper must have increased the social problems have not correspondingly decreased. The only way out of this dilemma is to invoke a new ghost – that of postmodernism.

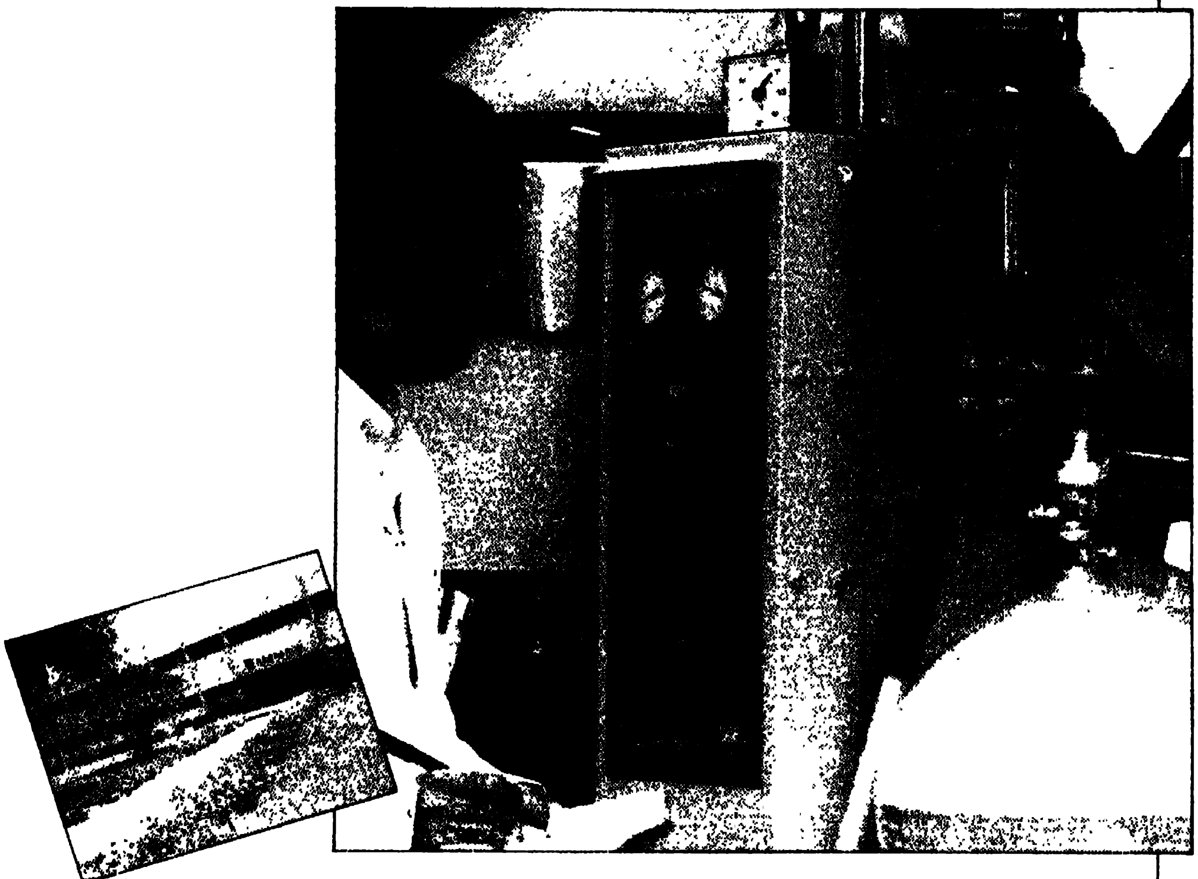
We translate 'technology' into 'care'.



Basic research is not only expensive but strenuous too. However, we at Hoechst, swear by it. In fact, we have spent close to Rs 500 million on research alone since the inception of the Hoechst Centre for Basic Research in 1972. And continue to spend over Rs 60 million every year. Besides this, we can also bank on considerable research inputs from Hoechst AG, Germany at no cost.

But then, research involves much more than money alone. It involves effort, time and dedication. In India, our researchers painstakingly collect and analyse hundreds of medicinal plants for clues to life-saving drugs.

It often takes over ten years for a product to graduate from the laboratory to the shop shelf. For every drug that makes it, thousands of others are screened and rejected.

We consider all our time and money well spent if we succeed in developing new products or even improving existing ones. To ensure you get the best.

That's Hoechst care for you. Putting our money on research so you can win the race against disease.

Hoechst

Our efforts, your smile

Vol XXXIV No 14 April 3, 1999

Competitive Populism and Subsidies

An examination of the nature of subsidies in Tamil Nadu and the causes and consequences of their growth brings out how the competitive populism of political parties has led to a distortion of the subsidy system in India. Besides the statistics, qualitative evidence too shows that the subsidy system in Tamil Nadu is wasteful, corrupt, regressive and counterproductive. 811

Dalit Strategy in UP

After establishing its monopoly over dalit votes, especially among the numerically large jatavs and pasis, the Bahujan Samaj Party is trying to turn the electoral arithmetic in UP in its favour by wooing the upper castes who are no longer in direct conflict with the dalits because of the structural changes in the rural areas. 822

Union Budget and Industry

A close examination of the union budget for 1999-2000 suggests that the budget's impact on industrial growth during the year will be more through its proposals which relate indirectly to the industrial sector as a whole or to specific sub-sectors than through measures more directly calculated to stimulate industry. 827

Serbian Hegemony and Yugoslav Break-Up

The tenacity of ethnicity and finely differentiated versions of South Slav nationalism, sharpened by frequent foreign domination of the region in the past, defeated Tito's federative design as well as international efforts, through threats of withholding of credits and non-recognition of secessionist republics, to save Yugoslavia from Balkanisation. Serbian domination of state power, unwarranted by population size or economic strength, has provoked assertion of non-Serbian ethnic identities. 833

Dictated Agenda.

Study of non-Bengali writing in Bengal exposes the bias in the way the Bengali 'bhadralok' have implicitly set the norms for other communities, such as the Calcutta marwaris, whose lives are shaped by ideologies quite different from those that matter to their socially-distant Bengali neighbours. 804

Rights Denied

The beginning of the Kashmir problem as well as its aggravation over the years can be traced to the denial to the people of the state of civil liberties and democratic rights including the right to freedom of speech, to protest and form opposition parties and to vote and form a government of their choice. 794

Kols Dispossessed

Evicted from their ancestral lands by the British and in the post-independence period swindled by government officials and local politicians, the Kols of Mirzapur district of UP, once a self-sufficient tribe, are being pushed into a situation of perpetual dependency. 798

Banking Reforms

The flip side of banking sector reforms has been the over-emphasis on profits and the neglect of the distributive role of banks. 797

BJP Games

Even as storms gather around them, the ostriches in the BJP-led government bury their heads in the sands. Worse, they make clear their utterly cynical attitude towards governance. 796

Resilient Microfinance

The impact of the 1998 floods, the worst ever to hit the country, on Bangladesh's critical microfinance sector needs to be analysed at three levels: the client and the household, the individual microfinance provider and the overall microfinance industry. 801

National Income

An explanatory note on the methodology of the CSO's new national income estimates and tables presenting the new data series, together with the comparable earlier estimates to bring out the significance of the revisions. 841

Bihar: Emerging Forces

YOUR correspondent's editorial comment (February 6-12) expressing a need for unified retaliation against the Ranvir Sena (RS) by the naxalite groups is to be appreciated. The comment that the earlier "landlord armies...had to beat a hasty retreat in the face of the armed resistance of the naxalite groups", is also well taken. Yet, the approach that 'internecine clashes' are a major cause for the rise of the RS displays a lack of knowledge of the ground realities in Bihar. Some facts may help give a clear picture.

First, the two remaining naxalite groups in the region – the erstwhile Party Unity (PU, now PWG) and MCC – have been attempting to strike back in their own ways. After Narayanpur, the PWG struck twice at some chief RS rowdies, while the MCC struck with a mass massacre of bhumihars. The ex-naxalite group, Liberation, has been relatively quiet. After the Arwal massacre, the Liberation and PU, during 1985-86, jointly organised mass protest campaigns. But when the Liberation drifted into parliamentarism it backed out of the anti-Arwal Front in a bid to gain parliamentary respectability. Later, the rise of the RS, which had made Bhojpur its breeding ground, was facilitated by the inertia of the Liberation group. For two years, 1994 to 1996, despite the killings of Liberation supporters, there was no effective counter to the RS's growth. This emboldened the Sena further which, from the end of 1996, began spreading to neighbouring Jehanabad, the centre of PU's activity. After one or two RS actions the PU immediately hit back. Besides a big campaign against the RS (which was viciously attacked by the police), throughout 1997 the PU eliminated 22 RS elements in four separate actions. In 1998, too, it kept up the pressure. But the RS, relatively secure in Bhojpur, used that as a launching pad for further attacks.

What needs to be appreciated here is that the RS is qualitatively different from the "earlier landlord armies". The two cannot be compared. While the earlier formations were caste-based and amateurish, the RS has the support of most caste landlords, has strong political backing, and has been equipped with vast funds and sophisticated weaponry. They have been trained by local army officers, who took leave for the purpose. They are a ruthless, cruel and large (relative to the earlier formations) mercenary force. It is not that easy to fight it. The earlier senas were smashed, even though, at that time, the naxalites were divided. Quite naturally, to take on such a ruthless force (backed fully by the state machinery), Liberation's non-retaliatory parliamentary tactics have been rather insufficient. Though the PU/PWG and MCC have been striking back, the defeat of the Sena may take quite some time. So, the prime factor for the rise of the Sena is state backing, and the inter-naxalite clashes can only be secondary. That, the latter exists, is not disputed. It is, in fact, very unfortunate; but is secondary to the issue under discussion. The PU, it appears, has time and again tried to resolve the problem, but the MCC has continued its aggressive posture killing a large number of PU supporters. Hopefully, the present merger with the PWG may help settle the issue, as the PWG has experience in settling similar conflicts in AP over a decade ago. Yet, the battle with the landlord/government mafia is necessarily a long drawn-out one.

Chennai

Kamani Experiment

E A RAMASWAMY'S in-depth analysis of workers' co-operatives (January 30) is a subject that has much wider application in India. He has rightly pointed out that in the initial euphoria, workers guided (misguided?) by their leaders, to seek short-term gains, form co-operatives to manage an organisation, as in the case of Kamani. That management is a science with its complex functions and responsibilities is not at all understood when such co-operatives are formed. Without going much further into the details of workers' co-operatives (of which I am a strong supporter), the main purpose of this letter is to draw a comparison of the attitude o non-governmental organisations (NGOs which have similar approach to managin their organisations.

In over 15 years of my association wit NGOs in India, I have come to realise tha as long as funds are given as grants b the government or donor agencies, th organisations set up for achieving socio economic benefits, function effectively After all, there is a limit to grants extende by the government or donor agencie Grants, of course, initially cause som social changes, but economic succes which ensures sustainability and long-term social development calls for applicatio of management concepts. Economic success, undoubtedly, requires risks to b taken. Also, the decision-making, the cor of management practices, cannot be veste with an unwieldy group. The line o command is essential and accountabilit at every level of production is important However dedicated the individuals ma be, if everyone attempts to impose his/he concepts, objective management is im possible. Above all, groups owing allegiance to political parties attempt to tak control of the organisation, which mean that the objectives of the organisation wil be subservient. With the phenomena growth of socio-economic problems bot in urban and rural areas, NGOs have a important role to play. It is all right t depend upon grants only for welfar activities such as public health and education, but socio-economic projects mus be approached with a different attitude t ensure economic sustainability and consequently a long-term social development

Tamil Nadu

Tax Reform Debacle

THE efforts which have been going on for the last five years to reform the diverse systems of sales taxation operating in the different states and to replace them with a Value Added Tax(VAT) have been dealt a mortal blow. Maharashtra, the only state which had dared to go the whole hog towards introduction of VAT, has abandoned the reform path and decided to return to the beaten track of a sales tax laced with a turnover tax and a surcharge on 'gross tax'.

Moves to replace the states' sales taxes and switch over to VAT were initiated in 1994 as part of the economic reforms launched in 1991. The system of sales taxation that had evolved over the years was perceived to be a major impediment to efficiency in resource use and to the growth of a national common market which is among India's greatest potential economic strengths. With over 20 different legislations each following its own pattern and with a multiplicity of levies and rates and little co-ordination, our sales tax system had earned the dubious distinction of being the most complex and irrational in the world. Revenuewise also the system had ceased to be productive, as buoyancy had dropped below unity in practically all states, thanks to the internecine rate wars and competitive bids on the part of all the states to attract trade and industry to their respective territories through generous tax holidays. In a protected market and with the bounty of a central law that gave them the power to tax interstate sales – something not permitted in mature federations such as the US and Canada – the states have got into the habit of exporting their taxes and obtaining a good part of their revenue by taxing residents of other states and thereby encroaching on each other's tax space, negating the federal principle.

The only way to remove these inefficiencies and distortions and bring some rationality in the states' taxation was to move towards a VAT such as has been in vogue in many countries, including in federations and economic unions, whereby the tax incidence falls on consumption instead of production and tax revenue goes to the unit where the taxed goods are finally consumed, the point of destination. Based on a model drawn up in consultation with state tax administrators and taking account of the deliberations of a committee of chief ministers and finance ministers, a tentative programme of reform was drawn up over 1995 and 1996, first to harmonise the states' sales tax systems and eventually to move to VAT. Although the much-needed abolition of the tax on interstate sales was virtually shelved, for fear of immediate revenue loss, the rest of reform programme would, if implemented, still mark a significant improvement over the debilitating system that had been operating so long. However, in the absence of a binding agreement the programme did not really get off the ground, though there was some move to reduce the number of tax rates in several states. Some went through the motions of introducing VAT by selecting a few commodities for taxing the value added in trading, but abandoned the effort as unfruitful, the principal examples being Kerala and Tamil Nadu.

Maharashtra was the only state that made a serious attempt to replace its sales tax with VAT. Beginning in 1995 with a high threshold, it inserted two new sections in the existing law that almost transformed its sales tax into a full-fledged VAT, subject of course to the limitations that any state would face when going it alone. Initially it operated both the methods used in VAT, the credit method for inputs used in industry and the subtraction method for traders. The aim was to move eventually to the standard credit method along with a wide base, easing out the tax holidays and other concessions. Though revenue suffered a setback in the initial years, the state government courageously persisted as industry clearly benefited. Manufacturing cost in several industries, particularly automobiles, registered a significant decline. Opposition to the change was also contained as the high threshold helped to keep down the number of dealers coming within the tax net to less than 10,000 initially and possibly not more than 50,000 or at the most 1,00,000 even with the gradual lowering of the threshold. After the inevitable teething troubles Maharashtra seemed well set to act as a model for the other states.

Scrapping of the VAT by the Maharashtra finance minister in his budget for the current year has thus come as a shock and a serious setback to the effort that has been going on to introduce a less distortionary trade tax system in the country. The grounds advanced by the state finance minister for the government's decision mentioned the difficulties taxpayers were experiencing in complying with the requirements of the new system and the unhappy experience of Kerala and Tamil Nadu. While in Kerala and Tamil Nadu VAT is little better than a caricature of what it is meant to be, the reference to traders' difficulties is baffling since one of the strengths of Maharashtra's VAT lay in the care that had been taken, through a high exemption limit, to keep out small- and even medium-sized traders. Revenue stagnation, on the other hand, may have been a real problem. But how much that had to do with the shortcomings of the tax and to what extent it was a reflection of the recession in the Indian economy is a moot point. Undeniably, the state did face handicaps in recouping the revenue forgone through the tax credits by unilaterally adjusting upward the rates on final products because of competitive rate-cutting by neighbouring states and the

restrictions on the level of tax on the so-called 'declared goods' flowing from the rule embedded in the Central Sales Tax Act, a central enactment. It is not known whether any request had been made by the Maharashtra government to the centre for help in getting the restrictions removed or for assistance in tiding over the adjustment period. From all appearances, the centre remained a disinterested spectator. Be that as it may, the development will gladden the hearts of those who have been opposed to VAT, regarding it as an imposition from the centre. The demand will now be made more insistently for the 'consignment tax' without which, it has been claimed, the states' tax revenues have been suffering grievously. But that would be the final blow against a national common market in the country.

To those working towards a rational tax system to prepare the country for the new millennium, the debacle in Maharashtra cannot but be a matter of deep disappointment. The emergence of VAT as a major instrument of taxation has been the most significant development in the evolution of tax structures across the world in the last 50 years. VAT now operates as the main consumption tax in some 105 industrial and developing countries. It is not just fashion that has set this trend. VAT scores over other forms of indirect taxation in many important ways. A well-designed VAT is a reliable revenue raiser entailing less cost than its rivals. It has the merit of neutrality in the matter of economic choices such as location and form and method of doing business and thus encourages efficiency. What is more, it strengthens domestic industry in competing globally by minimising the possibility of cascading inherent in turnover-type sales taxes and freeing exports from taxes levied at earlier stages of production and sale while extending equal treatment to imports and local products. In other words, it has attributes that are important in an increasingly integrating, competitive world. It is not for nothing that the European Union requires adoption of destination-type VAT as a precondition for membership, even though this means some surrender of fiscal autonomy on the part of sovereign nations.

All this notwithstanding, it is not altogether surprising that the Maharashtra government has chosen to go back on what little progress had been made in the direction of fiscal reform. Policy-making in this country is finally in the hands of people who rarely have the time or inclination to acquire the degree of understanding needed to cope with the technical issues that often come up in many fields including taxation. An important factor in the present debacle has been the centre's passivity. It is now abundantly clear that it is not possible for VAT to operate successfully at the sub-national level without the active involvement of the centre. But where is the time for the central government and its officials dealing with tax policy to involve themselves constructively in what goes on in the states? Why stir up a hornet's nest by poking a finger in an area that the states regard as their preserve? So while sovereign nations in other parts of the world come together to harmonise their tax systems and agree to desist from taxing citizens of other nations to reap the advantages of larger common markets, we in India revel in clinging to our old ways, however damaging they may be to the present and future generations. The fact of the matter is that, the limited vision of the regime currently in office in the state apart, Maharashtra did not get the support it deserved from the centre in its bold endeavour. But who cares?

POLITICS

Preparing for the Inevitable

THE BJP national executive committee meeting at Goa looks like a dress rehearsal for the electoral propaganda that the party might have to launch if it loses power at the centre and has to face another round of polls in the near future.

The main objective of the resolutions adopted at the meeting is to isolate the Congress and the opposition and warn its own unreliable allies of the consequences they will have to face if they desert the BJP. The BJP hopes that the three 'B's – the (nuclear) Bomb, the Bus (journey to Pakistan) and the Budget – will help it to win a popular mandate. In order to counter the opposition charges of administrative irregularity on the issue of the ex-naval chief's dismissal, it is raising the bogey of national security in order to defend its opposition to a parliamentary probe into the matter. As for the allegations of financial wrongdoing levelled by Mohan Guruswamy, it hopes to put the opposition, and the Congress in particular, on the defensive by resurrecting the Bofors issue. The BJP is also making the most of the Congress opposition to the imposition of president's rule in Bihar and projecting the Congress as an anti-dalit party, thereby hoping to gain the votes of the depressed castes. Regarding the immediate threat posed by Jayalalitha, the BJP is working out a strategy to offset her withdrawal of support by winning over a few fringe groups (like Kanshi Ram's BSP) in the Lok Sabha. This explains home minister Advani's claim that "even if the ruling coalition is reduced to a minority, it will continue to rule the country", and the prime minister's bravado at the Gaya meeting that he was confident of 'managing the numbers'.

But despite the brave face being put up by BJP stalwarts, things are not all that hunky-dory in their own backyard. While they may have succeeded in cajoling disgruntled allies like Mamata Banerjee, they are facing threats from their own party people and comrades in the Sangh 'parivar' have already shattered the myth about the BJP being a highly disciplined party. Close on the heels of the resignation of one-time BJP ideologue Guruswamy and his allegations of corruption against the finance minister has erupted another crisis. In Uttar Pradesh, following the resignation of a minister from the BJP government in the state, a large group of BJP legislators have raised the banner of revolt against chief minister Kalyan Singh and demanded his resignation. And, although the 'swadeshi' lobby did not make much noise at the Goa meeting, it is still quite active in its campaign against the economic policies of the government. Besides, those members of the BJP who are active in the RSS, VHP, Bajrang Dal and similar outfits are on the war path determined to build the Ram Janmabhoomi temple.

The BJP is increasingly becoming a schizophrenic organisation split into factions which are divided by personal loyalties, ego clashes, power hunger, different perceptions of tactics and conflicts on the economic perspective. How are the BJP leaders going to resolve these growing internal contradictions? The Goa meeting of its national executive failed to address this critical question and ended up instead as an exercise in chalking out a fire-fighting programme to cling to power as long as possible, and an electoral strategy to face the voters when this becomes necessary.

MEDICAL EDUCATION

Extreme Close-up

THE MBBS marks scandal, as the newspapers are dubbing it, in Mumbai University is now at a stage when the fundamental issues which have been raised will be all but forgotten. The governor, also the chancellor of the university, has issued a show-cause notice to the vice-chancellor,

Snehalata Deshmukh, asking for an explanation for the award of some eight grace marks to students in the paper on preventive and social medicine (PSM) after declaration of the results. As may be recalled, the 64 students of the final MBBS course had petitioned the vice-chancellor to award grace marks in the PSM paper, which they claimed had been a difficult one, so that they could secure passing marks in that paper. The petition was granted, but later investigations have posed several issues: that according to relevant statutes grace marks cannot be granted after the results of the examination concerned have been declared; that if the paper was 'difficult' the students ought to have petitioned the right authorities immediately after the examination and not after the results had been declared; and, most importantly, that the 'difficult' paper does not appear to have contained any question which may be construed as being beyond the comprehension of an MBBS student.

The issue has since snowballed, with the Maharashtra Medical Council appointing an independent inquiry and holding the act of the vice-chancellor untenable and contravening of the statutes. The result has been to bring about a confrontation – with students protesting and the issue being raised in the state assembly – which does not portend well for medical education in the city. The governor's show-cause notice is the culmination of all these developments. And now the Akhil Bharatiya Vidyarthi Parishad has claimed that the governor's notice to the vice-chancellor amounts to interference in the autonomy of the university.

It is indeed a pity that so much attention should have been focused on this issue when there are so many other urgent matters pertaining to higher education in the city and the state which need to be resolved. It should be clear to the government now that creating an independent university of health sciences to which all medical colleges in the state will be affiliated will involve more than just the passing of legislation. Not only will the relative responsibilities and authority of the state medical council need to be defined more clearly, but the problems of affiliating to the university of far-flung colleges should be evident. At another level, many recent reports have brought out that fraudulent degree-holders are practising as doctors. This is evidence of laxity on the part of the medical council. It should be noted that the state medical council has until recently been a moribund body doing little to either monitor medical practice or to enforce legislation with regard to the quality of education in medical colleges. That it has become so active on the issue of the marks scandal is commendable, but rather surprising. The logical follow-up should be for it to set up a review of the process by which a student is declared as having graduated – that is, the process of evaluation in the medical education system. But there seems to be little indication of any such move.

Unfortunately, and perhaps inevitably, the MBBS marks scandal while it has exposed deficiencies in the system has also become an issue which is being taken up in the corridors of political power rather than evoke institutional/academic concerns. With the show-cause notice, the issue has now been relegated to merely a matter of interpretation of a rule.

ALL-INDIA RADIO

More of the Same

A correspondent writes:

THE winds of liberalisation have blown nothing new in the All-India Radio network, judging from the report of the standing committee of parliament on communications on the working of AIR. AIR routinely falls short of its targets. It gives lack of funds as one of the reasons for this. Yet, during the Eighth Plan, it utilised only Rs 657 crore of the allocation of Rs 835 crore. In 1997-98 as well only 62 per cent of allocated funds were spent. In spite of this, the parliamentary committee approves of the proposal to levy a licence fee on stereo radio to raise revenue.

Non-availability of staff is another reason cited. AIR's training centres are in bad shape: some of them without buildings or staff, without any studio or technical equipment and without hostels. Two large centres, though commissioned, are not functioning for want of teaching staff. AIR does nothing to assess the utility of training imparted to its staff. But it has invited the Thomson Foundation of the UK to run a training programme for its staff.

Undaunted by these problems, AIR thinks big. Where a private entrepreneur may start with one station, and having made a success of it, learning from mistakes, take up the next one, AIR took up 23 radio stations in the north-eastern states. Only five of these have been completed. Seven were dropped/deferred due to financial constraints and 11 are delayed. But worse, the five completed stations have not been commissioned – one due to law and order problems and four due to delay in staff selection.

The parliamentary committee worries that this will exacerbate "the feeling among the people of north-east that they are being neglected". But perhaps the north-easterners, like most Indians, know that bungling is a way of life at government organisations and that they have received no more than their share of 'sarkari' inefficiency.

AIR also thinks big when it comes to promoting new talent. Normally new talent would be trained and then used to improve existing stations, and old experienced hands would be used to make a new channel successful. Not so at the AIR. It has an entire new channel, the Yuva (Youth) Channel, purportedly to encourage new talent. Is it possible that AIR's other channels are saturated with talent? It is not surprising, then, that in the Eighth Plan funds sanctioned for commissioned programmes were not utilised and had to be surrendered.

AIR's idea of talent and quality of programming may be gauged from the nature of its programme advisory committees. Their composition requires that there be at least one member representing 16 listed discipline/interest groups among which one finds '(xv) Humour'. Its idea of listeners is equally cheerless. Listeners are not a market, not intelligent people with their own views and choices. They are beneficiaries. The committee says of FM transmitters that people "falling within this range are benefited by them". Can we visualise these people, ears cocked, mouths agape, waiting for benefits to fall from the AIR?

The parliamentary committee is ambivalent about FM channels. It does not like that private broadcasters are allowed to "propagate pop and western music that has nothing to do with Indian ethos/culture". It recommends that guidelines should be framed for private broadcasters. But since FM channels can earn revenues up to Rs 30,000 to Rs 35,000 per hour, it wants more FM stations to be commissioned. This is the familiar idea that the private sector should make profits so that the government sector can both earn revenue and disapprove of the activity which generated that revenue.

Talk of liberalisation notwithstanding, AIR remains bureaucratic and unimaginative. And the elected representatives of the people serving on the standing committee of parliament do not recommend any different.

CURRENT STATISTICS

EPW Research Foundation

RBI's signals of a lower interest rates regime have been reflected in major public sector banks and FIs reducing their PLRs to the lowest ever levels of 12-13 per cent. Anticipating a further fall in interest rates, FIIs have started investing in rupee-denominated debt. In March alone they bought debt securities worth $36.2 mn, after having been net sellers to the tune of $175 mn in the whole of 1998. Renewed interest by FIIs in the equity market as well led to investment worth $51.8 mn in March against disinvestment of $163 mn in the whole of 1998. These combined with reported increases in FDI augmented foreign currency assets by $828 mn in March.

BASF INDIA

Growth in Sluggish Market

AFTER witnessing a sluggish performance in 1996-97, BASF India, a leading chemicals multinational, performed well in 1997-98. At a time when most businesses faltered as far as profitability was concerned, this subsidiary of the German giant BASF AG managed to notch up a 11.7 per cent increase in net sales and a 4.4 per cent rise in its bottomline over the previous year. While the company's operating profit improved by 4.9 per cent over the same period, a steep increase in depreciation provision (up 43.1 per cent) was offset by a fall in interest charges (down 35 8 per cent). With earnings per share rising from Rs 10 to Rs 10.5, the company decided to raise the dividend rate from 30 per cent last year to 35 per cent. Book value moved up from Rs 100.4 per share to Rs 107 per share. The company's stock presently quotes at Rs 180 on the Bombay Stock Exchange, discounting its 1997-98 earnings by a comfortable 17.2 times. Encouraged by its performance, BASF India has decided to issue bonus shares in the ratio of one equity share for every two shares held by capitalising a sum of Rs 8.05 crore out of the amount standing to the credit of the company's share premium account.

BASF India is a well diversified chemicals company with a major presence in leather chemicals, crop protection chemicals, plastics, and colours and dispersions. It also has a chemical business providing technical advisory service fee. The company produces as well as markets expandable polystyrene, tanning agents, leather chemicals, and auxiliaries, pesticides, oil and well chemicals. While about 40 per cent of turnover consists of leather chemicals, 27 per cent comes from crop protection chemicals, while a further 20 per cent is brought in by colours and dispersions, and the balance from plastics.

A dark cloud on the horizon, however, has been the company's plastics business which was adversely affected due to depressed domestic market and availability of cheap imports.

BASF India has decided to shelve the implementation of the Rs 20 million Carbendazim FL project due to adverse market conditions. The funds which had been earmarked for this project will reportedly be deployed for future capital expenditure programmes. The company had raised Rs 57.5 crore by way of a rights issue in the ratio of 2:5 at a price of Rs 125 per share to part finance the expansions and new projects at its plants in Mangalore and Thane. Of the Rs 81 crore capital expenditure programme planned during the issue, the company has successfully completed the colours and dispersion projects in Thane and Mangalore respectively. With the commissioning of its new plants, BASF India plans to give a thrust to exports.

For the first quarter of 1998-99, BASF India has further improved its performance. While net sales improved by 17 per cent over the corresponding period last year, operating profit was higher by 16 per cent and net profit increased by 20 per cent over the same period.

GUJARAT ALKALIES & CHEMICALS (GACL)

Market Misjudged

Fluctuating commodity cycles and downslide in the chlor alkali sector saw Gujarat Alkalies & Chemicals (GACL) perform poorly in 1997-98. Ironically, two years ago, the company was at its peak. Encouraged by its performance, it decided to undertake capacity additions to take advantage of healthy price trends. Unfortunately, offtake from key user-industries such as paper, chemicals and fertilisers turned poor and supply soon outstripped demand by nearly 40 per cent. Naturally, the excess supply in the industry soon led to a fall in capacity utilisation of the sector from 78 per cent in 1995-96 to 60 per cent in 1997-98. Domestic price of caustic soda too fell sharply over the same period and the company's sales and profits were adversely affected. The mismatch in demand-supply forced GACL to delay the commissioning of its 350 tonnes per day (tpd) caustic soda unit. Though the company does enjoy an edge over other competitors because of its energy efficient membrane cell technology as also the power back-up it has from the captive power unit only a revival in demand for caustic soda can help it tide over trying circumstances.

While the company's net sales in 1997-98 declined by 17.6 per cent over 1996-97, operating profit fell drastically by 43.4 per cent. A fall in non-operating profit (down 45.8 per cent) and a steep increase in depreciation (up 16.7 per cent) led to a further fall of 97.6 per cent in the company's bottomline which was virtually wiped out. The company skipped dividend.

With power always being a major input in the caustic soda industry, GACL has done well to set up a captive power unit. The company is supplied more than 50 per cent of its power requirements for its Vadodara complex at an economical rate from Gujarat Industries Power Company, which itself was promoted by GACL. Further GACL's 90 MW captive co-generation power plant at Dahej which had been put into trial production in the open cycle mode from November 1997 will make available reliable power at an economical cost. In fact the company has also finalised arrangements with the Gujarat Electricity Board for wheeling of power from Dahej to its Vadodara complex. When the wheeling commences, the Vadodara complex will also have the benefit of low cost captive power generation and will become self-reliant for its power requirements.

Meanwhile, the company's 350 tpd caustic soda unit, which was reportedly intentionally delayed due to market conditions, has been completed and trial production commenced in February 1998. The caustic-chlorine plant is expected to meet the total requirement of hydrochloric acid for its phosphoric acid unit and will further help to cater to the demand for caustic soda and chlorine from nearby industries and for exports.

The company's equity share is presently quoted at around Rs 20 on the bourses.

GUJARAT STATE FERTILISERS AND CHEMICALS (GSFC)

Rescued by Diversification

Commencing operations around three and a half decades ago, Gujarat State Fertilisers and Chemicals (GSFC) managed to tide over the fluctuating fortunes of the fertiliser industry by diversifying into the allied segments of petrochemicals and chemicals. The diversification is what helped the company hedge against the frequent policy changes that the sensitive fertiliser industry is susceptible to. In fact, today the company draws more than half of its annual sales from non-fertiliser areas. The company's product portfolio includes petroproducts and chemicals like caprolactum, melamine

NA: means not available.

and polymers, besides nitrogenous and phosphatic fertilisers. The company manages to draw maximum returns by concentrating commodities which are on the uptrend.

Restricted operations at its Fertilisernagar units following a closure order passed by the Gujarat High Court in *suo motu* proceedings affected the company's performance in 1997-98. Capacity utilisation of the company's fertiliser plants was lower at 91 per cent as compared to 110 per cent achieved in the previous year. Similarly, production of caprolactum declined from 63,901 tonnes in the previous year to 59,501 tonnes, representing a fall of 7 per cent. However, with the commissioning of the melamine expansion plant, production of melamine during the year improved to 6,315 mts against 5,440 mts in the previous year. GSFC was reportedly at loggerheads with the Gujarat State Industrial Development Corporation (GIDC) over the price of 120 hectares of land proposed to be acquired by GSFC at Dahej. In fact, GSFC, in its annual report for 1997-98, openly blames GIDC for demanding a high price for the land, whereas GIDC when approached claimed that the price was far from high. GSFC had proposed to acquire the land at Dahej, a fast growing industrial centre in south Gujarat in Bharuch district, in 1995-96. The company had stated in its annual report earlier that considering the constraints of further space at its Fertilisernagar plant, it planned to acquire land through GIDC for further expansion as also keeping in mind the future growth potential.

Meanwhile, during the first quarter of 1998-99, shutdown of plants for annual maintenance and closure of the Sikka DAP plant from June 9, 1998 on account of a cyclone resulted in lower production. The Sikka plant, however, was retarted from July 17, 1998 and the damage to the company's property is not substantial and was reportedly fully insured along with loss of profit cover. Turnover for the quarter was Rs 435 crore as compared to Rs 484 crore in the corresponding period of the previous year, representing a fall of 10 per cent. This was mainly because of the lower production of DAP fertiliser. Further, the union government reduced the ad hoc subsidy on di-ammonium phosphate by Rs 250 per tonne to Rs 3,500 per tonne and on ammonium phosphate sulphate by Rs 108 per tonne to Rs 1,630 per tonne from October 1997. To make matters worse, there have been substantial increases in the input cost of DAP.

Kashmir Problem Thrives on Denial of Human and Democratic Rights

Balraj Puri

Looking back objectively, one can trace the beginning of the Kashmir problem and its aggravation to the denial to the people of the state of civil liberties, of democratic and human rights including the right to freedom of speech, of the right to protest and form an opposition party, of the right to vote and to elect a government of their choice.

I VALUED an opportunity, first of its kind, to interact with army officers on the issue of human rights at a seminar organised by 15 Corps at Jammu on December 21, 1998. It indicated the degree of importance that the subject as also the maturity that the army had acquired. It reaffirmed the army's commitment that violations of human rights was not a part of a deliberate policy of the army.

It would have been more useful if the occasion was used for a thorough and frank debate on the type of violations, reasons thereof and measures to minimise them. But the organisers seemed more keen to use the seminar to answer the charges of Pakistan and the militants or their overground outfits.

That the state of human rights is very bad in Pakistan is neither a news for me nor any matter of consolation. Those who vaxed eloquent at the seminar to prove that India's record of human rights is better than that of its western neighbour did their country no honour. Nor are the excesses of militants a valid alibi for similar excesses of the army. For one is in revolt against the nation, its government, laws and constitution while the other has vowed to protect them.

Those who presented the case of the army or those who sought to glorify its role presumed that the human rights issue was "another game plan of the proxy war waged by Pakistan to defame India and its forces". This amounts to either an unwarranted attack on Indian human rights activists and their patriotism or recognition of only those activists who are part of Pakistan's propaganda machinery.

That Pakistan has given arms and training to Kashmiri militants and is now sending non-Kashmiri militants who do commit excesses was more credibly exposed by international human rights organisations like Amnesty and Asia Watch as also Indian human rights groups than by all the government propaganda. Their role should therefore be welcome; also for improving the performance of the security forces. Those who write off all of them as an adjunct of Pakistan's proxy war are, in fact, trying to give Pakistan a monopoly of sympathy for the victims of human rights violations which are inevitably committed in varying degrees by both sides in the proxy war. If some of the victims look to Indian human rights activists for sympathy and redressal, is not that a national gain?

True, some of the reports of Indian human rights organisations have been quoted by Pakistan in international fora. But so would be the case with the judgments of courts, findings of the national and state human rights commissions and reports in the press. Should all these institutions be abolished? And is it the case of the government of India that no violations of human rights have ever been committed by its security forces? Would it carry better conviction? In fact all that is expected of the government is to prove its earnestness in checking them.

For this purpose an active human rights movement in Jammu and Kashmir state is as much a national asset as any other institution mentioned above. It is not that the militants always take kindly to the work of human rights activists who are exposed to risks from both sides. While Jalil Andrabi was allegedly killed by the security forces, many people in Kashmir accuse the militants of killing Hirday Nath Wanchoo, A A Guru and Abdul Ahad. Those who killed them damaged their own cause. Looking back objectively, one can trace the beginning of the Kashmir problem and its growth to its present dimensions to the denial to the people of the state of civil liberties, democratic and human rights including the right to freedom of speech, right to protest and form an opposition party, right to vote and to elect a government of their choice – which have been taken for granted in the rest of the country. Whenever these rights were restored, Kashmir became as much a part of the country, emotionally and politically, as any other part. The greatest triumph of India after independence was the willing accession of the Muslim majority state of Jammu and Kashmir to India in 1947 as the national leaders had supported the democratic struggle of the people against its ruler.

Today it has become the biggest problem of the country. Soon after accession of the state to India, Sheikh Abdullah, who was the hero of Kashmiri nationalism, with unprecedented popular support, came to power. But he cannot be credited with tolerance of dissent and commitment to democratic values. He ruled in a constitutional vacuum in which government officers could become leaders of the National Conference (NC) and vice versa.

The first fissures in the monolithic politics of Kashmir and the leadership of the regimented NC occurred when Ghulam Mohi-ud-Din Qarra parted company with Sheikh Abdullah in 1948. I pleaded with Nehru that his loyalty to the country need not be routed through Abdullah and that his democratic right to oppose the state government should be recognised. Nehru dismissed my suggestion with the plea that nothing should be done to weaken the Sheikh. Qarra and his group remained under persecution. In sheer desperation he raised the first pro-Pakistan voice in Kashmir in June 1953 which disturbed the equilibrium of Abdullah who in order to steal the new thunder of the challenge to his authority started making anti-centre noises. His differences with the centre gradually were enlarged due to other factors also, leading to his dismissal and arrest in August 1953.

In the election to the state constituent assembly, the National Conference led by the Sheikh won all the 75 seats. While nobody dared file a nomination paper against the NC in Kashmir, in Jammu region nomination papers of opposition candidates were rejected. Again it was the only state where government officers could become office-bearers of the ruling party and vice versa. In such a regimented set-up, secession became the only outlet of popular discontent.

Similarly I pleaded with Nehru that a pro-India party, by providing a proper channel to anti-government sentiments which developed after Abdullah's arrest, would prevent them from becoming anti-India. For this purpose I proposed to organise the state branch of the Praja Socialist Party. Nehru again dismissed the idea as he would not like to weaken Bakshi Ghulam Mohammad despite all his faults. When we arrived in Srinagar to formally inaugurate the party in November 1954, party president Asoka Mehta along with all of us were physically beaten and bundled out of the valley.

In 1958 G M Sadiq led his leftists group out of the NC to form a pro-India opposition Democratic National Conference. But the national leaders and the press were again alarmed over what they called "disunity in the ranks of nationalist values". The two parties were thus pressurised to reunite in 1961. The entire national media hailed that as a triumph of the national interest. In 1967 Bakshi Ghulam Mohammad revived the NC when the ruling national official group led by Sadiq had converted it into the Pradesh Congress Committee. Nomination papers of its candidates in 38 constituencies were rejected. A number of duplicate ballot papers were in circulation which I personally presented to the chief election commissioner. He simply argued that Bakshi also used to do that. In fact the election to the state assembly were never fair. That Sheikh Abdullah won cent per cent seats in the first elections in 1951 does no credit to his popularity and to his stature as a great leader. However, whenever the opposition party was tolerated and people had the right to protest and choose their government freely anti-India sentiment got sublimated.

After Sheikh Abdullah's return to power, he acquired real moral and political legitimacy when his party defeated the main opposition, the Janata Party, in the fairest first ever election in 1977 when people of the state for the first time recognised the potentialities of being Indian citizens. The fact that they could elect a government of their choice and could defeat even the party in power at the centre gave an enormous sense of confidence to the people of Kashmir in being Indian citizens.

It was a similar experience in 1983 when Farooq Abdullah led his party to victory against the Congress Party which had by now become the ruling party at the centre. The beginning of the present phase of the Kashmir problem can be traced to his dismissal in 1984 and his reinstatement in 1986 when he agreed to form a government in coalition with the Congress Party. It was the biggest blow to the self-respect and dignity that the people of the state had acquired. It blocked all secular outlets for protest. The manipulation in the elections of 1987 further blocked democratic avenues of protests. Having been frustrated in expressing their discontent through the ballot many Kashmiri youth took to the method of the bullet.

The moral of the above experience is that in the case of Kashmir, loyalty to India and loyalty to the government of India have always been treated as synonymous. It was due to this policy that the secessionist movement started after 1987. And the way the movement was sought to be checked added fuel to fire. In June 1988 a demonstration held in Srinagar to protest against the sudden and steep rise in power tariff was fired upon killing three persons. The demand for an enquiry into the firing was rejected as it was condemned as anti-national. Soon it became an all-Kashmir protest which turned violent.

Spoardic terrorist acts started thereafter. In the early hours of January 20, 1990 Srinagar city was cordoned off for a wholesale and ruthless search of every household. It provoked widespread protest. The protesting processionists were allowed to come from different parts of the city to a place called Gow Kadal where they were fired upon which resulted in the killing of 35 persons, the highest number of persons ever killed in a day in Kashmir till that day. While no gain from the operation was clamied, it triggered off a mass insurgency.

How counter-productive ruthless actions of this type are is indicated by the way the funeral procession of Moulvi Farooq was fired upon. Though according to popular perception he had been killed by militants, the firing in a narrow lane of Srinagar which killed over 60 mourners merely succeeded in diverting popular wrath from the militants to the Indian government.

A number of such incidents can be quoted. Whenever people became disillusioned and angry with Pakistan their sentiments were submerged by some tactless act of the security forces. The success of the security forces in getting the seige of Hazratbal lifted brought appreciation for the goverment of India from all over the world. But soon after the killing of 50 persons at Bijbihera by the BSF did more damage to the goodwill that India had earned. In 1998 when militants killed 26 Kashmiri Pandits at Wandhama, every Mulsim was visibly shocked. Next day the killing of seven Muslim youth in Kishtwar by the security forces was exploited by Pakistan to give a call for a 'bandh' throughout Kashmir and Pakistan and thus to submerge the sense of shock of Kashmiri Muslims by a wider Muslim protest. The series of mass killing of Hindus in the Jammu region had similarly loaded the Muslim population with a sense of guilt, but the killing of 19 Muslims in Surankote allegedly by the army reduced their guilt and thus in a way facilitated the task of the militants to extend their activities.

It can be proven with abundant empirical evidence that independent monitoring of human rights violations serves the national interest best, prevents further alienation of the people, prevents defaming of India abroad and helps in improving the discipline of the security forces.

Fun and Games for BJP

Arvind N Das

Even as storms gather around them, the ostriches in the BJP-led government bury their heads in the sands. Worse, they make clear their utterly cynical attitude towards governance.

DAYS before Jayalalitha caused a political earthquake in Delhi, the Vajpayee government celebrated its existence extravagantly. It had some reason to celebrate. The last time Atal Behari Vajpayee headed a government, it lasted in power for a mere 13 days; this time it had completed a year in office. It is another matter how that feat was accomplished but the likes of the enthusiastic Pramod Mahajan were not concerned about that. Theirs was not to examine how; theirs is but to try and wow! And that is what the government tried to do as it unleashed one spectacle after another in a fit of self-congratulation. If symbolism overtook substance, that did not bother the prime minister and his drumbeaters.

In fact, it was not coincidental that just when the BJP-led government was gleefully patting itself on the back the country itself experienced a different order of events. The very day that Pramod Mahajan ordered the initiation of the fun and games and had Doordarshan launch a Sports Channel, 37 people were murdered in Bihar in the gruesome game of death that has been played there. The utter incompetence of the Vajpayee government in handling Bihar was exposed mercilessly but the enactment of the massacre precisely when the prime minister was using the idiot box to address the nation did not dull the celebrations.

The spirit of the celebrants was also not curbed by the fact that for days on end the sordid Bhagwat and Guruswamy episodes had been laid out before the nation and parliament had been so rocked by these that it had transacted no business at all. Nor did it bother those who determine the contours of the Vajpayee government that the picture it presents to the public is one of abject surrender to unreasonable allies, succumbing to all vested interests, making the worst possible compromises merely to survive a little longer in office. The incompetence of the government has been demonstrated repeatedly. Now not only is its ideological inconsistency apparent but 'insiders' like Mohan Guruswamy have started revealing its lack of probity too.

Look at the charges made by the erstwhile economic advisor to the roll back finance minister, Yashwant Sinha. Look carefully at three specific allegations: those relating to fixing the price of Enron power, those regarding the proposed sale by the Unit Trust of India of ITC shares to British American Tobacco (BAT) and those concerning giving up management control over Maruti Udyog to Suzuki. What stands out in the first case is sheer incompetence or worse in negotiating a higher power purchase rate with Enron than the rate which even Pakistan was able to get. In the second, what is obvious is the desire to please the foreign peddlers of tobacco by handing over a major Indian company to them in a situation where there can be no invocation whatsoever of public interest of any sort. In the third instance too the willingness and even eagerness to surrender the very crown jewels of Indian industry is apparent. In all these cases, the hollowness of the claim of the BJP of propagating 'swadeshi' has been adequately exposed by the party's own handpicked in-house economist and publicist. Indeed, Guruswamy has demonstrated that the Bharatiya Janata Party (BJP) speaks with the proverbial forked tongue: it hisses both 'swadeshi' and globalisation simultaneously. The problem for the BJP is compounded by the fact that it has to combine loyalty to finance and industrial capital with a petty bourgeois social base. Thus, while on the one side, its leaders have no choice but to play footsie with multinational companies, they also have to project to their traditional supporters that they have not given up their old prejudices.

This involves walking on the political razor's edge. The Sangh 'parivar' has tried to achieve this by splitting itself up into several organisations, each with a slightly different orientation. Thus, while the parent body, the Rashtriya Swayamsevak Sangh (RSS) thrives on projecting values of 'discipline' and 'nationalism' to the mufassil youth, the Vishwa Hindu Parishad (VHP) battens on unabashed bigotry, inciting communal passions for the RSS storm-troopers to step in along with the uncontrollable lumpen elements who form the Bajrang Dal. Meanwhile, even as new converts to the BJP ideology like finance minister Yashwant Sinha and power minister Rangarajan Kumaramangalam try to project the party as an united entity in parliament and elsewhere, according to Mohan Guruswamy, the faction-ridden party itself cuddles up to various vested interests.

It is the deep factionalism within the BJP that has manifested itself even during the 'birthday bash' of the government. It was surely not coincidental that both party president Kushabhau Thakre and the 'Number 2 Sardar Patel', home minister L K Advani, kept away from Pramod Mahajan's fun and games. It was also not coincidental that Sushma Swaraj, who has been replaced by Pramod Mahajan in the ministry of information and broadcasting, not only absented herself from the showbiz extravaganza put up in Hauz Khas but even apologised to her constituents for the 'mess' made by Mahajan. And, of course, even as the prime minister and his Sancho Panza were deep into celebrating their feat of survival, the deep fissures in the party's UP unit were becoming apparent to all.

In the government too there is no assurance of stability. The Chautala Lok Dal has already withdrawn from the coalition. The Bihar state unit of the Samata Party has split and the party's MPs are unlikely to be immune from the effect of the split. The humiliating exit of Gurcharan Singh Tohra from the Shiromani Akali Dal is not likely to be ignored by the SAD MPs loyal to him. And can the BJP really assume the continued support of the mercurial Mamata and Jayalalitha?

The fact that parliament went into a mid-session recess when the BJP launched its fun and games must have provided some comfort to its managers for things had started turning too hot for it just when the party was beginning its celebrations. The attitude of the Congress in the Lok Sabha and the Rajya Sabha had clearly started indicating that Sonia Gandhi was no longer content with playing the role of the 'constructive opposition'. Indeed, Atal Behari Vajpayee acknowledged as much when he said that the Congress has begun to act as the "destructive opposition". The Guruswamy and Bhagwat issues have come so handy to the Congress to gain political advantage that it is unlikely to left the opportunity pass. Even the schedule of parliament agreed on before the recess makes it clear that the Guruswamy and Bhagwat matters will continue to rock both the houses when they reconvene later this month.

But then even as storms gather about them, the ostriches in the government bury their heads in the sands. Worse, they make clear their utterly cynical attitude towards governance. They ignore people dying in Bihar because that is 'normal' but how long can they afford to take no notice of the crime wave in the capital? It is not clear that the BJP and its allies have even realised that governance is different from giving people a song and dance routine.

Banking Sector Reforms

The Other Side of the Coin

P N Joshi

The flip-side of banking sector reforms has been the overemphasis on profits and virtual neglect of the distributive role of the banks. Now, only strong and high net worth companies within the organised sector are capable of raising funds at a considerable lower rate of interest, while the credit disbursal to small borrowers has sharply declined.

FOLLOWING the recommendations of the Narasimham Committee (1991), a series of reforms, including a move towards international accounting standards, viz, income recognition, asset classification, provisioning and capital adequacy, were introduced since 1992-93. Considerable attempt has been made to impart transparency to the balance sheets of banks. A good deal of uniformity in computation has helped to compare meaningfully performance of different banks. Inevitably, progress of the reforms in the banking sector has been assessed in relation to the mesaures initiated during last five-six years. There has not been any attempt to look at the flip-side of reforms. In fact, there is a deliberate attempt to gloss over the dark side of the reforms, concentrate on the positive aspects and harp on the achievements.

It is customary in all assessment exercises to consciously neglect the dark side of performance. Nonetheless, it needs to be emphasised that utter neglect of the repercussions of the policy ultimately results in a self-defeating exercise. The victory won often turns out to be a pyrrhic victory. The society pays a heavy cost for achieving the results. It is necessary, therefore, to look at the other side of the coin and initiate steps in right earnest to rectify the deficiencies at the right time.

The authorities have a natural tendency, strongly supported by acolytes, to move towards the objective with missionary zeal. They have no patience to listen to the criticism while all praise for the reforms is not only welcomed but is solicited. It may be recalled that after the nationalisation of 14 banks in July 1969, the overriding objective was to take banking to the 'masses'. The resounding voice of the slogan from "class banking to mass banking' rent the air with full vigour. A feeble voice in those days about 'recovery or profitability' was totally brushed aside. None had the time to listen to these terminologies in the early seventies. Similarly, today none has the time to listen to the slogan of "mass banking" and therefore, social aspect of banking has lost its glitter. While the facade of priority sector lending continues, the fact that lending beyond Rs 25,000 is subject to commercial rate of interest is proof enough of the dilapidated condition of the social lending concept. It is interesting to see that the reforms introduced since 1992-93 in the banking system have had a heavy toll of small borrowers. It is a fact, which has remained obscure, that between end-March 1992 and end-March 1996 the number of borrowal accounts has declined sharply from 65.9 million to 56.7 million, i e, by more than 9 million It is pertinent to note that during the four preceding years, i e, between March 1989 and March 1992 the number of borrowal accounts had increased sharply from 52.1 million to 65.9 million, i e, by 13.8 million The increasing trend of credit disbursal to a large number of small borrowers arrested with the introduction of banking sector reforms and the spread of banking credit facilities was not only halted but the number of small borrowers getting financial facilities sharply declined during the five-year period ending March 1996.

Unfortunately, beyond March 1996, data in respect of borrowal accounts are not available. It is more than certain that the number must have further declined since March 1996. This clearly establishes the fact that the social content of Indian commercial banking has been given a decent burial. Thanks to the reforms!

It is possible to surmise that the decline in the number of borrowal accounts in the banking system could be due to two factors: (i) neglect of small borrowers, and (ii) write-offs in small accounts where the Deposit Insurance and Credit Guarantee Corporation of India (DICGC) claims were received.

(i) *Neglect of small borrowers:* The banking sector reforms strongly emphasised the importance of profit. It is well known that the operational costs of managing a large number of small borrowal accounts are high and the rate of interest on such small accounts is low. The threat of account becoming non-performing looms large. Therefore, obviously, there is a natural urge among the bankers to avoid increasing exposure to the small sector. This reduces the number of borrowal accounts.

(ii) *Write-off in small accounts where DICGC claims were received*: The overriding importance under the reforms, of reducing the NPA ratio, compelled the banks to have a second look at the large number of accounts where some recovery was effected through the receipt of funds from the DICGC. In a number of accounts the DICGC reimbursed the banks at the cost of its health, to the extent of 50-60 per cent of the outstanding balances. Under the reforms package, full provisioning was needed for the remaining balance in the borrowal accounts. Instead of making full provision which necessarily has to be after tax, the banks preferred to write off the remaining balance in such accounts and therefore the number of borrowal accounts vanished from the banks' ledgers. This trend must have been accentuated after March 1996, when full provisioning as in the case of larger accounts was introduced as against the percentage provisioning in the case of small accounts.

An almost unintended impact of the reforms has gone virtually unnoticed. The compulsion on banks to reduce their non-performing assets ratio has given rise to munificent benefits to wilful defaulters. Narasimham Committee report (II) has emphasised that the net NPA ratio of banks should be brought down below 5 per cent by year 2000 and it should be brought down below 3 per cent by 2002. (Banks having international exposures should bring down their net NPA below 3 per cent by 2000 and to zero per cent by 2002.) In the absence of proper atmosphere for recovery of bank loans in the form of efficient legal system, effective debt recovery tribunals (DRTs), fear of severe punishment for cheque bouncing, social stigma for wilful defaults, etc, banks, being forced to reduce NPA, had no alternative but to make compromises with wilful defaulters. This led to settlements of debts and compromises of loans at a high social

TABLE BORROWAL ACCOUNTS IN THE BANKING INDUSTRY

(in 000s)

Year	No of Borrowal Accounts	Variance No of Accounts	Per Cent
March 1989	52113		
March 1990	53851	+ 1738	3.34
March 1991	61946	+ 8095	15 03
March 1992	65862	+ 3916	6.32
March 1993	62116	- 3746	- 5.69
March 1994	59651	- 2465	- 3 97
March 1995	58097	- 1554	-2.61
March 1996	56672	- 1425	- 2.45

cost. The defaulter was the gainer, banking system was the loser.

The reforms have also unwittingly led to mis-allocation of funds among different segments of society. The small sector, particularly weaker sections, is gradually being eased out, despite tall claims of schematic lending. Even within the organised sector, it is the strong and high net worth companies which are raising funds at a considerable lower rate of interest. Strong and efficient banking is identified with profits. Prima facie, it sounds logical. But, profit has become the "be all and end all" of banking today and banks are becoming averse to lending. Even though SLR has been reduced to 25 per cent, investments are increasing at a faster rate in government securities, in Commercial Paper, NCDs, bonds, debentures, etc. Income, and not sectoral distribution of credit, has become the obsession with bankers. This has led to mis-allocation of funds. Financial discipline is at a discount. The corporates are exploiting the situation. Credit discipline is evaded by floating NCDs and preferential shares at lower rates much below the PLR. Banks subscribe to these instruments at rates lower than PLR, since PLR discipline does not apply to investment return. The corporates thus get funds at rates lower than PLR without the hassel of adhering to current ratio, stock statements, QIS, etc. It is interesting to see that banks identified as the most efficient in the nationalised banking sector at the end of March 1998, had channelised higher percentage of incremental resources towards investments than credit. Thus, the distributive aspect of banks' funds is getting distorted. Distributive justice is thrown to the winds. The 'fear psychosis' has been bandied about as the reason for lending fatigue. Equally, if not more, important reason for lending fatigue is the overemphasis on 'profit'.

It is important to note that it is possible to make profit through policy diktat in a single activity of banking and show good results. For instance, in 1997-98, YTM was reduced from 13.56 per cent in March 1997 to 12.15 per cent in March 1998. This helped banks considerably to shore up profits. Some banks made huge profit by trading in government securities and the amount was used for provisioning, write-off, etc. It is debateable whether stray profit in one or two banking activities could be interpreted as 'sound and efficient banking'.

Yet, another impact of the banking sector reform, which has escaped attention is the substantial expansion of foreign banks in the country. At the end of June 1991 there were 24 foreign banks operating in India with a branch network of 140. At the end of June 1998, the number of foreign banks has substantially increased to 42 and their branch network also has gone up to 182. During 1997-98 alone, the total assets of foreign banks in India have increased by more than Rs 10,000 crore. It is learnt under the World Trade Organisation (WTO) Agreement a minimum of 12 licences every year have to be issued to foreign banks or their branches. This will ensure fast spread of foreign banks' operations in the country. Gradually, these banks are spreading their tentacles to the suburbs of the 'metros', and to the commercially significant semi-urban centres. The long-term implications of this aspect of reforms needs to be studied in depth. In China, which is quoted as a fast liberalising Asian giant, there are severe limitations on the operations of foreign banks in the country. In a number of areas in China, foreign banks' operations are limited to funds acquired from abroad. Perhaps, a review of our policy has become imminent.

It is undeniably true that the introduction of reforms process has paved the way for building a strong and efficient banking system. Its importance against the backdrop of recent happenings in the south-east Asian countries cannot be overemphasised. There can be no two opinions on the continuation of the reforms. And yet, the 'other side' of banking sector reform narrated above partly explain the predicament faced by the Indian banking system. Their low profitability is not merely due to the visible deficiencies in terms of low productivity, over-staffing, structural rigidities, etc. They, no doubt, have impinged on the profitability of the banks. But the issues narrated above have in a disguised manner reduced the financial muscle considerably. Their competitiveness is at stake because of the delicate financial health. Aims and the larger objectives of commercial banking in India appear to have gone haywire. These issues have gone unnoticed. It is the time we wake up!

UTTAR PRADESH

Kols of Korawal

From Sufficiency to Impoverishment

Kripa Shankar

Evicted from their ancestral land by the Britishers and swindled by government officials and local politicians in the post-independence period, the kols of Uttar Pradesh, once a self-sufficient tribe, are being pushed into perpetual state of dependency.

KOL tribe inhabits largely the Vindhya range in Uttar Pradesh (UP) and Madhya Pradesh (MP). In MP kols are recognised as scheduled tribe but not so in UP where they are included among the scheduled castes. Since time immemorial the kols subsisted largely on forest produce along with some crop husbandry. Extensive deforestation during the British rule disrupted their traditional support system and introduction of zamindari alienated them from the land. Their traditional community organisations were dismantled and a hostile bureaucracy was superimposed. They found themselves under a very hostile surrounding. Their access to forest was restricted and forest wealth was itself declining fast. The landlords were now masters of the land and in places where tribals were practising some agriculture after clearing the forest they would be forced to vacate as the landlords would appropriate such agricultural land claiming it be their own. The tribals would have no records to substantiate their claim on land and then retreat further into the forest, clear some land for agriculture only to be dispossessed again after some time. This is how agriculture spread in this area which simultaneously resulted in the alienation of their land. Many would then be forced to work as bonded agricultural labourers as the landlords could carry on agriculture only with the help of the kol labourers. They lived the life of a chattel although it was moderated by a patron-client relationship. As their dependence was total, sexual exploitation and humiliation was the order of the day.

Then came independence, abolition of zamindari and other land reform measures, initiation of planning and a developmental process along with elections based on adult suffrage.

How the post-independence development process has unfolded and affected the life and living of the kols is the subject matter of this study which was confined to a cluster of 10 hamlets predominantly inhabited by the kols in a largely inaccessible area known as Korawal of Hallia

block in Mirzapur district of UP on the border of MP.

Eviction from Land

Korawal part is upland, and on account of no roads and bridges over rivulets, used to be completely cut off during the rainy season. It was only last year that a bridge was constructed on river Kahejua. Now, the western part is no longer cut off during the rainy season though other parts still remain inaccessible. The block headquarter is at a distance of 20 kilometres from the study area and district headquarter is 75 kilometres. Only a few decades back it was a dense forest. At the time of zamindari abolition the raja of Vijyapur, who was going to be deprived of his estate, settled all such far-off land with his relatives, hangers-on and others who could approach him. The kols were nowhere in the picture. They did not know that the land was being settled or the fact that zamindari was being abolished. Even if they had known of it, it would not have mattered for they neither had any money nor could dare approach the raja.

In the post-independence period, in the name of development a so-called developmental bureaucracy descended in the area. The block headquarter was established in Hallia. This bureaucracy found a fertile ground in the tribal areas as many things could be done only on paper and money appropriated. Primary schools were established where teachers would hardly come to school. The gramsevak would only do paper work and embezzle the amount. Two co-operative credit societies were later on established which only specialised in giving fake loans. They have now been liquidated but the tribals, who never took any loan, are still being harassed and forced to repay the loans.

A medium-sized earthen dam, 7 kms in length was constructed on river Adva in this block in late sixties. The upland of Korawal region, being at a higher altitude remained unaffected by the dam's irrigation facility. But the northern part did witness growth of agriculture in the wake of creation of irrigation facilities where high-yielding wheat and rice crops replaced the traditional kodo and sawan. The influx of outsiders in the irrigated part became more pronounced as land productivity increased. Those who had acquired land from the raja of Vijyapur began to settle here and engaged the kol tribals as their 'halwahas'. The outsiders were from upper castes and were powerful persons with close links with the revenue bureaucracy. The lekhpal would be always at their beck and call. The construction of Adva dam had also brought in contractors and others, who acquired land.

Incidentally, seven, mainly tribal, villages were submerged. While landowners got compensation, the tribals were asked to move in the forest. Very few got any compensation. In many places where the tribals had settled and started some agriculture, the gram panchayats being dominated by landed elements transferred such areas to the forest department with the design that eventually the tribals would be displaced. The forest department is now trying to do so. Notices have been served and on few occasions attempts were made to physically oust the tribals. These attempts faced resistance, yet the battle continues even to this date. Last year the oustees in village Surajgarh organised a dharna for two days at the district court against the high-handedness of the forest officials.

Distribution of gram samaj land (GS), initiated in mid-seventies, was of great significance for the tribals. In the beginning they did not know that such a programme had been initiated. The powerful landowners, as a matter of fact, succeeded in getting such land distributed in favour of their kith and kin. So was the case with the lekhpals. The latter found a golden opportunity to acquire land through fake distribution of GS land to tribals contiguous to each other which later on could be developed as a mini farm. In the study areas there are two such lekhpals owning a farm and house each. As land was plenty, a fair number of tribals were also given land who could pay the lekhpal the money the latter demanded. But the tribals had their turn last. The better part of the GS land invariably went to those who were not eligible for it, and were in fact outsiders. The landowners had already been encroaching on the GS land as there was no one to object to it. The law stipulated that in such cases the village pradhan should institute a case against the trespassers. As the pradhans themselves came from landed gentry, they would not oppose such encroachment as it meant inviting hostility which may affect their election prospects. Besides, they will have to attend to the court matters for which no travelling allowance is admissible. The net result was that all such encroachments were overlooked.[1]

Distribution of GS land has been a continuing process as all governments promise it. Last time when the Bahujan Samaj Party formed its government, land distribution was again on the priority. Since there is now comparatively more awareness among the poor, blatant wholesale misappropriation of GS land is not possible. But this does not mean that ineligible persons were kept at bay. Land value has increased and those with money are prepared to pay the lekhpal any amount he demands. As a result, the outsiders again got the larger and better part of the GS land. The lekhpals have also devised more refined and sophisticated methods to circumvent the rules. While preparing the 'patrawali', the lekhpal abstains from giving any serial number to the list of beneficiaries in whose favour the land management committee resolves to distribute the land. Some space is left at the beginning or at the end and middle of the page. After the resolution is adopted and the members have signed the papers, the lekhpal inserts the names of those who have bribed him. The sub-divisional magistrate naturally approves it as he finds everything in order. This is done where the pradhan is not in league with the lekhpal but if the two combine, there is no end to the mischief. In the latest round, knowledgeable persons reported that at least one-third of the land was distributed to persons who were not eligible for it. The lekhpals now have greater opportunity to mint money. Landless people will flock to him and he will collect money with an assurance that he would give land. Then one fine morning he will get himself transferred. The new lekhpal will repeat the same story. Tribals have borrowed money to ingratiate him only to be cheated in most of the cases. But since land is in plenty, many kols have got the GS land and in our study area about 31 per cent of the kol households have been provided land under this programme over the years. More than one-fifth (22 per cent) of the land held by such households consists of the GS land. There still remains sufficient GS land in every village which has not been distributed. The lekhpal and the pradhan have a vested interest in keeping GS land undistributed as the former can use the bait of distributing the land on the eve of next panchayat elections and the latter can extract more money as the number of claimants increase and land value rises.

Pattern of land ownership among 626 kol households surveyed showed that 27 per cent of the households were absolutely landless. Another 3 per cent of the households had an average holding of 0.25 ha. Next 10 per cent of the households had an average holding of 0.46 ha. Thus, 40 per cent of the households comprised of landless and semi-landless with holdings of less than half hectare. The average size of all the holdings was 1.08 ha, and generally, the land was of inferior quality. There were eight big upper caste landowners in the study area who held 807 ha of land, which happens to be 20 per cent higher than what is held by 626 kol households. The average size of big land holdings was more than 100 ha, and the

largest one being 186 ha of land. The ceiling on dry land in UP is 18 ha. Thus, more than 10 times the ceiling land can be easily held in this area.

The Real Beneficiaries

Integrated Rural Development Programme (IRDP) likewise became an instrument for personal aggrandisement on the part of large landowners and the gram vikas adhikari (GVA), more so in the initial phase. The tribals and other poor were unaware of IRDP in the beginning. Landowners would take the thumb impression of their halwahas, ie bonded agricultural labourers, on the plea that the government had started a scheme to assist them. Nothing would be made available to them and the entire money would be appropriated by the landowners, the GVA and the bank functionaries. There are cases where landowners have renovated their houses, purchased motor cycles and other consumer durables through this device. In a glaring case, a tractor was purchased by a big landowner through this device. In the beginning no recovery notices would be served. Later came the loan waiver scheme. Under this scheme, photographs have to be affixed and the amount is given in form of cheque. Hence, gross misuse of the scheme is not possible; but a cut of 20 per cent is common in IRDP scheme loans.

A tribe of 'dalals' has appeared on the scene. They induce the poor to take loan from IRDP and they complete all the formalities. They induce the would-be beneficiary with the allurement that the loan would be written off and that they will see to it that notices are not served. In most cases, the beneficiaries get only half the loan amount while the rest is divided among the dalal, the GVA and the bank functionary. In such cases no productive work is launched while the amount generally goes into meeting consumption needs.

With the tribals getting scared due to recovery proceedings, the dalals too have changed their tactics. They assure the would-be beneficiary that loan amount will be immediately deposited so that question of recovery does not arise. In one village some 30 applications were submitted. Usually half of the money was given to beneficiaries. But now notices for full amount are being served.

In the study area we located 94 IRDP beneficiaries and 4 others who had taken loan from the Land Development Bank for purchase of pump sets. There were 12 IRDP beneficiaries who purchased pump sets which, except in two cases, were well functioning. The four beneficiaries who purchased goats, appeared to be doing well. Two beneficiaries purchased bullocks and their asset was intact. One beneficiary who started a barber's shop was also doing well. Two beneficiaries opened grocery shops while one started a cloth shop. None could survive beyond a year. Those who had pump sets from Land Development Bank were also doing well.

Deprivation and Immiseration

Only 8 per cent of adult kol males were literate and 2 per cent of adult females could be said to be literate. The primary schools do not function as the teachers do not come to school. A voluntary organisation in this area is active in the field of primary education and is running informal schools with local co-operation. In such villages 43 per cent of the boys and 25 per cent of girls in the age group of 6-14 were found to be attending these informal schools. Incidentally, in many cases these informal schools run by the voluntary organisation are held in government primary school buildings. The government teachers are happy that the schools are not deserted so that no one can detect their truancy.

Males constituted 57 per cent while females constituted 43 per cent of the kol population. There were more males than females in all the age group except in the age group of 55 and above where there were more females than males.

Occupational pattern of the males in the age group of 15-55 showed that 38 per cent were cultivators, another 50 per cent were casual agricultural labourers, 8 per cent were engaged in carpet weaving, while the rest were in miscellaneous activities or were unemployed. Among females, cultivators formed 51 per cent of the workforce followed by casual agricultural labour (28 per cent). Migration did not exist in this region a generation ago. Now, 18 per cent of males in the age group of 15-55 annually migrated for some days of work.

The prevailing wage rate for agricultural labourers in the villages is 3 kgs of wheat or 6 kgs of paddy. The migrants get higher wages ranging from Rs 25-40. Wages in kind is fast becoming obsolete.

Average yield of wheat was 8 quintals per ha on unirrigated fields and 20 quintals on irrigated fields. The yield of paddy was 25 quintals and 45 quintals, respectively. Value of agricultural produce per hectare is round Rs 4,000, including by-products.

A few generations back the kols appear to have had greater food security and better forest produce. Hunting and fishing were the favourite past-time. Every household would keep a number of milch cattle, mostly cows, as feeding them was no problem. Buttermilk, too, was abundant.

Over the years, forests have been denuded and the kols keep cows now not so much for milk but to use their dried dung as fuel. The cows are invariably rickety and those lactating give an average yield of half litre of milk a day. Very few households manage to consume milk or milk products. Mahua trees were abundant in the past. The poor were free to collect mahua flowers which besides being intoxicants, supplemented the diet. Every halwaha was also given a mahua tree as usufruct along with the 'kolia', i e, a small piece of land whose produce was to be exclusively consumed by him.

Foodgrain production has increased in the past decades but per capita per day production of the same was found to be 414 grams among the kol households, much lower than the requirement given that the diet almost exclusively consists of cereals. There is great shortage of pulses in an average diet. On an average a kol household consumes pulses for about 24 days in a year. For the rest of the year, bread or rice is taken with some seasonal home grown vegetable, potato, 'chatney' or simply with salt and chillies in lean seasons. In such times, food is cooked only once a day. A situation of semi-starvation generally prevails in July and August, and again in December and January for majority of the households.

With a view to have an idea of under-nourishment among children we took the height and weight of 301 male children and 175 female children randomly in the age group of 1 to 8 years in the study area and compared it with the standard height and weight. It was found that 92.7 per cent of the male children were under-weight and the percentage for the same was 93.7 among female children. This was more pronounced among lower age-groups both among male and female children. As regards height, it was found that 81.7 per cent of the male children and 80 per cent of the female children were below standard height.

Average household income of kol households was around Rs 10,000. Only three per cent of such households had income of more than Rs 16,000 which in fact is the cut-off point for poverty line. Crop husbandry accounted for 54 per cent of the household income, followed by income from casual labour (20 per cent). Sharecropping accounted for 12 per cent of the income. Carpet work accounted for another 8 per cent of the income. The share of forest produce in the household income was 6 per cent.

Carpet weaving and migration have been the two factors for modest diversification of the economy. With the former almost stagnating, out-migration is the only option

for survival. Intensive watershed development holds great promise for this area as it will regenerate land, water and forest resources while providing job within the rural area itself. But budget for watershed is minuscule. Development of piggery and poultry can be a big income generating source for kol households. But taboo against piggery is so strong that no one can think of it. The taboo against poultry farming is not that strong but the extension agencies have done nothing to popularise poultry farming among such households. Incidentally, supply of eggs to Mirzapur and elsewhere in eastern UP is mainly from Hyderabad.

Note

1 At the time of zamindari abolition about 24 lakh ha of GS land was vested with the gram sabha in UP. Mangaldeva Visharad committee which was set up by UP government to look into land distribution was constrained to find that by 1970 only 4 lakh ha of GS land remained with the gram sabhas. The government had no explanation for it. Obviously, this land was encroached upon by powerful elements. The landowners would sometimes take to more subtle methods. They would bribe the revenue clerks at the lower level who would make entry in the old village records that such and such GS land was given to the particular person by the zamindar. In such cases they would become the *de jure* owners of the land.

Microfinance Survives Bangladesh Floods

Nina Nayar
M Emrul Hasan Faisal

While floods have plagued Bangladesh for centuries, the 1998 floods have been recorded as the worst to hit Bangladesh ever. The impact of the floods on Bangladesh's critical microfinance sector needs to be analysed at three levels: at the level of the client and the household, at the level of the individual microfinance providers and at the level of the overall microfinance industry.

POOR people in Bangladesh have had access to microfinance services through various informal sources, including the moneylender, informal credit and savings co-operatives, rotating credit associations, religious institutions, etc. Formal co-operatives have also been in existence for several decades. However, these sources could not meet the growing financial needs of the poor. In the 1970s, several players piloted organised interventions to mediate financial services as a means to alleviate poverty. The most famous of these interventions is the Grameen Bank. Over the last two decades, microcredit providers have worked to use microfinance provision as an effective instrument towards improving the economic well being of families. Microfinance has contributed, indirectly, to building the self-esteem and self-reliance of the poor, giving them the confidence and the economic means to move them out of poverty into survival and beyond. Many institutions are now integrating microcredit into their ongoing social development programmes such as health, nutrition and education, so that clients of such programmes can absorb non-financial inputs more effectively.

Of the 7.5 million poor people served by non-governmental institutions in Bangladesh, Grameen Bank serves 2.36 million, Bangladesh Rural Advancement Committee (BRAC) 2.02 million, Proshika Manobik Unnayan Kendra (Proshika) 7,40,000 and the Association for Social Advancement (ASA) 7,10,000. These institutions and others are supported by international donors and a range of international NGOs. The World Bank supports the quasi-governmental second-tier institution, Palli Karma-Sahayak Foundation (PKSF) that on-lends to NGOs providing microfinance services. The Asian Development Bank (ADB) supports government sponsored-microfinance programmes which also have significant outreach.

Impact of the Floods

While floods have plagued Bangladesh for centuries, the 1998 floods have been recorded as the worst to hit Bangladesh ever. According to a World Bank report,[1] during the period of June to September 1998 more than two-thirds of the country was affected, with more than 1,00,000 square kilometres of land under water.[2] Significant loss of life resulted from flash flooding, drowning, water borne-diseases, starvation, snake bites and related accidents. Agriculture and horticulture which account for about 50 per cent of the country's GDP, encountered heavy losses – 36 per cent in rice production, 27 per cent in vegetable production, and 7 per cent in jute production, these being the primary products of the country.

The livestock, poultry and fisheries sectors were also hard hit, with losses of over 2,00,000 large and small livestock and 4,20,000 poultry heads. Over 45,000 hectares of fisheries sector were affected with losses estimated at US $32 million. These sectors which had been growing at an average annual rate of 8 per cent will likely shrink to an annual growth rate of not more than 3-4 per cent as a result of the flood.

Apart from the loss of lives and livelihoods, the flood had a major impact on the infrastructure of the country, with damages to 15,000 kilometres of roads, 14,000 schools, hundreds of bridges and culverts, and nearly half a million homes. The floods also resulted in food shortages and an increase in food prices. Preliminary estimates suggest that the country's annual foodgrain import cost will go up to a staggering US $930 million in 1999, which is almost a three-fold increase from the previous year. The shortage of food combined with distribution difficulties and hoarding, have resulted in a rise in food price inflation which was recorded at 10.8 per cent in September, up from 8 per cent in July 1998.

In summary, in less than three months, the flood caused direct damages totalling almost an estimated US $2 billion, equivalent to 8.6 per cent of the country's GDP.[3]

Impact on Microfinance Sector

The impact of the floods can only be understood by analysing it at three levels – at the level of the client and the household, at the level of individual microfinance providers (institutions), and at the level of the overall microfinance industry.

Many of the poor households that were affected by the flood have one or two members who are clients of organised microfinance providers. A majority of the outstanding loans were for investments in livestock, petty trading, paddy stocking, home improvements and sharecropping. Some clients had used some of the loan monies for medical treatment, the paying off of other more expensive loans, children's education or simply for usual consumption purposes during the traditional lean period. The loss of homes in addition to leaving families without shelter, also meant the loss of productive assets, including tools. In many cases, the house was also the workplace and storage place for goods and raw materials. Asset and income losses during the floods, for such clients, were disastrous, leading to extreme depression and sometimes suicide.

Grameen Bank reported the following story about a man from Selimbad village who was not a Grameen Bank member.

Md Jalu Sheikh worked as a daily labourer making bamboo stools. He had a large family with five sons and four daughters, but lived comfortably. A married daughter and her family lived with him. During the flood the house was inundated and ruined. The 13 member family took shelter on a nearby highway. They had no source of income, nowhere to borrow from, and little or nothing to eat. Jalu could not bear the sight of his childern starve and attempted suicide, but friends and family found him in time.[4]

Microfinance providers were affected in many ways, including:

- loss of income through repayment of interest,
- shortfalls in cash for new loans due to delayed repayments, drop in savings, and withdrawals of savings,
- unavailability of grant or loan capital during the crisis,
- client drop outs from groups,
- erosion of their capital base,
- difficulty in paying back institutional loans (borrowings for loan fund), and
- problems in meeting operating expenses.

The results of the Credit and Development Forum (CDF)-South Asian Network of Micro Finance Initiatives (SANMFI) rapid assessment[5] found that more than 60 per cent of the branch operations of NGOs providing microfinance services were affected, with operations having ceased for over 60 days. As field operations had to be ceased for weeks, many small organisations that had lent out most of their loan capital, consisting primarily or solely of members' savings were almost wiped out.

Repayments were also going to be adversely affected with projections for the flood period estimated at about 60 per cent whereas in June the repayment for the sector was 92 per cent. The loss of interest income was estimated at 54 per cent whereas in June it was only 5 per cent. The shortfall in cash for new loans increased from 18 per cent in June to an estimated 53 per cent in September. Although portfolio at risk could not be calculated for the sector as a whole, based on the figures for BRAC (20 per cent of total portfolio), Proshika (30 per cent) and Grameen Bank (50 per cent), the figure could be as much as 30 per cent, i e, US $5 million at risk for these three institutions alone.

Impact on Grameen Bank

Grameen Bank, the country's largest non-governmental microfinance service provider,[6] reported that 58 per cent of its centres were affected by the flood or which 42 per cent were declared 'disaster' centres. For Grameen Bank,[7] the 1998 flood was an opportunity to demonstrate the effectiveness of the micro-credit system in helping the poor to get back on their feet. Grameen Bank claims that it is institutionally equipped to cope with disasters. During the peak period of the 1998 flood, Grameen Bank suspended repayment collection and savings mobilisation in those Grameen Bank centres that were declared 'disaster' centres. It then established the needs of its members by having bank workers conduct evaluations – whether they required cash to purchase food, medicine, clothing, and materials to re-build homes. Cash and assistance in kind were provided on the basis of the evaluations. Also, members were permitted to withdraw up to 100 per cent from the Group Fund Savings. The Centre Disaster Fund and Centre Welfare Fund were expanded to meet the needs of those most seriously affected. These funds were provided as interest free loans.

Grameen Bank also provided relief aid to its members in severely affected areas by distributing drinking water, oral-saline, alum and water purification tablets. In order to prevent and contain health problems during the post-flood period, the Bank formed medical teams hiring local doctors to provide treatment and medicine to members and families. Grameen Bank workers ensured weekly contacts with all members to maintain morale. Bank workers went by boat to all members' houses in areas where centre meetings could not be held. In worst affected areas, cash consumption loans were immediately provided to those in need and repayments were rescheduled on a case by case basis.

Grameen Bank set up a Disaster Mitigation Task Force at the Bank Headquarters to collect information from the field. The information was compiled, analysed and disseminated by Headquarters to the different zones with the objective of informing policies for present and future flood management. Zonal Managers were convened to develop rehabilitation strategies, including discussions on new loan products, housing rehabilitation and agricultural rehabilitation programmes.

Reports showed that 157,000 (7 per cent of total active membership) had to seek shelter as their homes had been lost or seriously damaged. Bank workers motivated members to return to their homes, and informed them of the Grameen Bank's Housing Rehabilitation Programme. For those who required loan assistance for repairs, Grameen Bank provided supplementary loans to those who were already receiving housing loans as well as new housing loans. For those whose homes had been destroyed fresh housing loans were issued, with a flexibility to start repayments in January 1999. Since most Grameen Bank members are involved i the agricultural sector, Grameen Ban supported the revitalisation of the agri cultural sector as soon as the floods ha receded, by distributing half a millio vegetable seed packets procured from th Grameen Krishi Foundation.

As the flood waters receded and th situation began to normalise, the Ban began to resume its normal activities suc as centre meetings, collection of saving and gradually the repayment of loan Members continue to receive medical treat ment, with a focus on children. Grамee has also secured the support of the Govern ment Livestock Department to provide vaccination programme for cattle, poultr and ducks. Rehabilitation programme such as tubewell repair and maintenance sanitation drives and encouragement o vegetable cultivation have also bee initiated. Grameen Bank estimated tha it would be on the road to recovery b December 1998.

Grameen Bank has reported that as result of this flood, the Grameen Ban disaster fund has been totally deplete The Bank has declared that it will nee as much as US $100 million[8] to ensur full recovery.[9] The Bank claims that it i not sourcing grants, but will be seekin low cost funds from local and internationa sources. The Bangladesh Bank has com mitted about US$46 million to Grameе Bank. The Bank has also appealed to PKS for assistance.

Impact on Microfinance Industry

The microfinance industry includes wide range of service providers includin specialised poverty lending institution (Grameen Bank), NGOs (ASA, BRAC Proshika BURO Tangail, Shakti Founda tion), co-operative banks, international an local government supported microfinanc projects, and private organisations provid ing microfinance services to the poor. Al these microfinance providers, big and small were affected by the floods. All of then reported significant losses of capital at th institutional level, and reported heavy losse at the level of their clients' households.

The most critical need for the industr was capital for making fresh loans for th rehabilitation of the loan programme, i order to jump start their clients, and ge them back on track. Whilst during th 1988 floods, grant monies were not difficul to procure, this time there was a shortfal of grants in the market. The delays i making a formal announcement of a dis aster situation did not help. Nonetheless donors, government and non-governmenta agencies came together to take action.

Given the drop in donor flows withi

Bangladesh, NGOs were finding it difficult to find the necessary external support. Despite the gravity of Bangladesh's disaster situation, donors found it difficult to respond in a satisfactory way given competing claims for flood relief from East Asia, assistance to mitigate the financial crisis in South East Asia, and increasing claims from Africa and Eastern Europe. In the period after the floods, the Central American disaster added to competing claims.

In this highly competitive environment for donor support for relief and rehabilitation aid, the larger NGOs, such as BRAC, Proshika, and Grameen Bank were able to secure some amount of assistance, although not the entire amount. These NGOs also have disaster funds and reserves they can draw upon. It was understood that even if the larger and more established NGOs were not able to fund-raise for their entire claims, these organisations would be safe because the donors who have supported them over the years would ensure that these organisations did not go under.

However, the situation was particularly difficult for small- and medium-sized NGOs as they have fewer donor relations. Most grass roots NGOs face constraints in fund raising as they are not based in Dhaka, lack access and lack the ability to draft complicated applications expected by donors. They also do not have the image of larger or Dhaka based institutions. It was clear that the development community did not have much choice, but to contribute to the rehabilitation of the microfinance sector, partly in order to prevent a crisis of confidence in the sector.

It can be argued that since the top 20 NGOs account for as much as 85 per cent of total outreach and volume of microfinance, the small- and medium-sized NGOs are of little consequence. Yet in absolute terms, the remaining 15 per cent account for at the very least one million poor families. There is a social responsibility to these poor for the safety of their savings, the future of their families and also to the NGOs that provide essential services to these poor.

Action within the Sector

Despite the gravity of the situation, there was general agreement within the microfinance sector that it would work together to ensure that the government did not advocate for loan forgiveness. It would insist on maintaining discipline in existing microfinance programmes. There would be efforts made to assess the true extent of losses to assess damage and need for bail out and then make provisions for capitalisation depending on size and nature of institution. There would be a genuine effort to identify 'good' organisations from 'bad' with an effort to capitalise 'good' organisations.

Long-term actions would include an action to turn 'disaster' into opportunity, by consolidating the industry and focusing on minimum standards for MFIs. The industry would develop and agree on minimum donor and government standards for supporting microfinance initiatives. There would be efforts made to develop a coherent sector strategy to address disasters in the future.

Given the need for greater information to inform appropriate action, a number of donors, NGOs and academic institutions, initiated rapid assessments conducted on the impact of the flood. One such initiative was the CDF and SANMFI joint study supported by the Local Consultative Group Sub-group of Donors for Microfinance.

The CDF-SANMFI study found that the microfinance sector in Bangladesh has the commitment and the capacity to heal itself and move forward. Performance in the sector was reasonably sound prior to the flood and until the time when operations ceased. Unlike previous experiences where the government called for global moratoriums and loan forgiveness, this time microfinance providers across the sector, including the commercial banks and government agencies advocated sound policies for the post-flood rehabilitation period. Most NGOs advocated for no loan forgiveness and moratoriums only in selective cases, with no more than one month. Rescheduling would be only on a case-by-case basis for no more than one year. Acknowledging potential defaults due to the situation faced by their clients, the NGOs anticipated potential write offs, but committed themselves to making significant efforts to help their clients recover and in turn recover the loans.

Once the waters receded from their areas of operations, MFIs quickly resumed field operations responding to clients' requests for new loans to revitalise their home economies. However, such responsiveness towards progress and rehabilitation depended largely on the availability of fresh funds for the sector. The real need within the sector was to meet the financing requirements of clients before the next agricultural season. Fresh loans from the MFI sector would enable clients to re-establish economic activities quickly thereby reducing arrears and default. Loans from the sector would also reduce dependency on moneylenders who would otherwise be the sole source of working capital.

While there was no absolute figure for the funds required for capitalising the sector, it was estimated that the NGOs collectively, excluding Grameen Bank, would require as much as US $100 million. There was also strong sentiment that donors should consider the establishment of a separate 'Disaster Fund'. The governance of such a fund would have to ensure the interests of the smaller and medium sized MFIs.

Looking Beyond the Crisis

CDF as the national level network for microfinance practitioners would facilitate the interests of the sector as a whole, emphasising the needs and interests of smaller NGOs. CDF would also assist in setting performance standards among these smaller organisations and work with the microfinance industry to develop better disaster mitigation strategies. CDF and SANMFI will be conducting a follow-up needs assessment which will be published in May 1999. The study will also attempt to create a rationale for a Disaster Fund for the microfinance sector in Bangladesh, as well as the appropriate modalities for disbursement and replenishment.

Notes

2 Paper presented by Dipal Barua, general manager, Grameen Bank, entitled 'The Grameen Strategy to Combat the Flood of 1998', October 1998.

3 UNDP Bangladesh Assessment, 1999.

4 Reported by Md Abdul Khair, zonal manager, Grameen Bank on September 21, 1998 District: Rajshahi. Volunteer translator: Bitalie Islam. The Poverty Research Unit of Grameen Bank co-ordinated an effort involving all the major NGOs to record over 2,000 cases of flood victims from all over Bangladesh.

5 These figures are based on estimates reported by NGOs during the peak period of the flood in September 1998 SANMFI, CDF and the MFIs will work to update and verify these figures over the next year as the sector rehabilitates itself.

6 There are other governmental programmes including the Bangladesh Rural Development Bank (BRDB) programme that have a larger cummulative outreach.

7 All information on Grameen Bank is from the paper entitled 'The Grameen Strategy to Combat the Flood of 1998' by Dipal Barua, general manager, Grameen Bank, October 1998.

8 Reports from Grameen Bank, interviews with Grameen Bank pesonnel, World Bank assessment and PKSF assessment.

9 In assessments conducted by CDF and SANMFI in September 1998 as well as a study conducted by the World Bank and PKSF, it was estimated that the other NGOs in the microfinance sector would collectively require less than US$100 for rehabilitation

Hindi Literature as a Political Space

Marwari Women's Fiction in Calcutta

Anne Hardgrove

By looking at non-Bengali writing in Bengal, this article attempts to confront the bias in the way that the Bengali 'bhadralok' have implicitly set the norms for other communities, like the Calcutta marwaris, whose lives are shaped by ideologies quite different than their socially-distant Bengali neighbours.

THIS article addresses the topic of Constructing Femininities in Bengal by examining the interplay between the production of sentiments, feminism and history in two short stories of the Calcutta marwari writer Alka Saraogi. In analysing the production of sentiments and their use of feminism and history, I attempt to examine the relationship between ethnography and literature, and consider how works of fiction can be a productive site to illuminate objects of anthropological analysis.[1] It is worthy of mention here that Saraogi comes from the marwari community of Bengal, a community of traders and industrialists often defined as the 'others' of the less business-minded Bengali bhadralok. By looking at non-Bengali writing, I attempt to confront the bias in the way that the Bengali bhadralok have implicitly set the norms for other communities, like the Calcutta marwaris, whose lives were shaped by ideologies actually quite different than their socially-distant Bengali neighbours.

Even though literature arguably engages in aestheticising experience, it has the advantage of highlighting, spotlighting, and even exaggerating sentiment as a key component of the narrative. As such, literature can make sentiments the object of analysis for the anthropologist. Literature documents the work of sentiments, while out of necessity magnifying them, and thus makes them visible to the reader. The sentiments expressed here are not necessarily invented ones, for their effectiveness comes from their quality of being shared by the author and the reader. The intersubjective hermeneutic between the author and the reader is what makes such sentiments documentable.

It is in this sense that I take short stories, novels and fiction in general to be defensible primary texts for ethnographic consideration. I am not making an argument about the readership of the stories, and whether or not Saraogi's work has had a prescriptive effect on the lives of north Indian and Bengali women.[2] I am more interested here in the way that the relationship of marwari women to the past is revealed in the stories as the main character's sentiment expressed towards older family members. This approach therefore puts aside questions of readership and the overall social impact that Saraogi's stories might have on a larger reading public.

The two short stories are published in a collection entitled *Kahani ke Talash Mein* ('In Search of a Story').[3] The first story, entitled 'Lal Mitti ka Sardak' ('The Red Dirt Road') discusses a woman named Vandana's experience in taking short trip away from her husband and children, when she accompanies a female friend to a Bengali resort in Santiniketan. Vandana, the protagonist, lies restlessly in bed early one morning, unable to sleep because of the nervous thoughts circulating in her head. Vandana contemplates the guilt she feels by temporarily leaving her family to go off with a friend. Conversations she had with her son before departing for the station replayed themselves in her mind:

> "Mommy, did grandmother ever leave you like this, the way that you are leaving me?" Surprised at this unexpected question, she fell silent.
>
> Suresh, her husband, quipped. "Your Mom is modern, pal!!" Was there some irritation behind the way that Suresh was joking around?
>
> "No Bittu. No one can become modern by putting on airs. And see, when you grow up, then you will do a lot of things which I have never done. In this way everything keeps changing all of the time. I am not like Grandma, and in the same way you are not like me." Vandana said this in a confident tone without any expression on her face.

In this poignant vignette, Saraogi demonstrates the way that different generations of a single family can encounter modernity. Vandana's son points to the standards of the past in expressing his emotions, asking if grandmother had ever done this to her. Vandana's husband, on the other hand, tries to make a joke out of her modernity which will placate the son but perhaps add to the guilt that Vandana is meant to be feeling. Against these familial claims on her, Vandana must find a way to negotiate the guilt that her son and husband place on her for leaving them, if only for a couple of days. In her clever response about "everything changing all of the time", Vandana points out the way that the reproduction of gender roles never remains as constant throughout historical time. Instead, the definition of appropriate behaviour for kinship roles is always generationally relational to the seemingly personal experience of modernity.

But the emotional pain felt in the experience of expressing resistance to tradition is one that stayed with Vandana throughout her adult years. A second excerpt from the same story, also a flashback memory, relates back to Vandana's teenage days and documents the family's management of the so-called 'pollution'

associated with the taboo of women's menstruation. Vandana, her mother, her sister, her grandmother and her father were sitting around in the living room, relaxing and talking. Vandana's mother whispered to her,

> "Look, for two days don't sit on the bed and don't touch anything. Spread out the mat and sit on it, and at night take out the blue silk sheet and sleep on it. You understand, don't you, just as your older sister does, huh?" Mom whispered in her ear very responsibly. Vandana thought about the secret of the mat and the blue sheet many times, but without knowing everything she could not reach any decision. When she asked her older sister about it she became very irritated. As soon as their mother went away Vandana climbed into the lap of her sister and went to sleep on the bed.
>
> [Vandana said] "I will not sit on the mat, nor will I sleep on this sheet, and when I touch you, you will become polluted yourself. Now what will you do?" Grandma sat quietly and ran her fingers through Vandana's hair.
>
> [Her father said to the grandmother] "Mother, what is this, aren't you going to explain it to her? What are you doing? She is touching everything." Vandana became very startled at hearing her father's words. Does he want things to be like this?
>
> "Now, she is only a girl, slowly she will begin to understand, son." Grandmother ignored her son's rebuke. Months and months passed like this. But in spite of the displeasure of her mother and father, she stood firmly on her decision, with the support of her grandmother.
>
> In the end her older sister also protested, "What is this? Different rules for her and different rules for me." At first Vandana's protest was successful, then it became clear that her weaker position had intelligence as its only weapon, and this was a very unstable base. Vandana eventually became so insulted that she lost her stubbornness and afterwards she just always went along with her father's will.

One can easily read this account as Vandana's expression of feminist resistance to her father's patriarchal insistence on the secret of the mat and the blue sheet. Climbing onto her sister's lap, sleeping on the bed, announcing loudly that she will intentionally touch things and pollute others during her period are part of Vandana's understandable guerilla tactics to foist change onto her family. What is more surprising about the story is Vandana's intergenerational source of allies. The sister, after all, takes her time in coming to Vandana's defence, let alone adopting these strategies for herself. Mother and father represent the patriarchal status quo. While running her fingers through Vandana's hair, the grandmother is the one to support and defend her in the present, interestingly enough, and does not necessarily champion tradition in the threatening face of modernity. Admittedly; the grandmother's alliance with modernity may not be permanent, and she does not claim that Vandana will always be this way. "Slowly she will understand, son."

This intergeneration component suggests new ways to think about the relationship between the forging of Indian feminisms and the construction of the past. The nuclear family has been characterised as modern and fundamentally progressive, in its presumption of newness and breaking ties with the past. Yet the feminism articulated in the stories does not form a revolutionary break with the past. Instead, Saraogi's story highlights how sentiment itself holds together the present and the past; in the form of solidarity between the grand-daughter and grandmother. This alliance with the past, rather than a struggle against it, creates an affective relationship to the past which is expressed as practices of emotive affect, with the grandmother "running her fingers through her hair". The figure of the grandmother represents the affect of kinship inherent in constructing an emotive present in relationship to a lived past.

The second story, called 'Ek Vrat Ka Katha' ('The Tale of a Fast') narrates a woman named Amita's practices of ritual fasting, known in Hindi as 'vrat' (literally, vow). This particular fasting day was called 'bachwaras', a day when Hindu women would fast for the well-being of their sons. Amita, the main character, recognised the importance that her mother-in-law placed on keeping the fasts, so she followed the rituals just to keep her mother-in-law happy. But Amita's habit of feeling hungry as soon as she got up always caused her trouble on the days of fasting, and she would sometimes forget about the fast and mistakenly have something to eat. Her mother-in-law tried to quell her habit of eating right when she got up. The mother-in-law told Amita that it was the duty of women not to eat before men, and that she should eat only after all of the male members of the household had eaten. Amita had hardened herself from such unspoken disapproval from the very beginning and never waited for her husband to eat before her. She could not imagine living life the way that her mother and mother-in-law had done, being incapable, she felt, of raising any objection. How could they tolerate so much?

That bachwaras' day Amita fought with her brother-in-law, with whom she generally shared a close joking relationship, about not making him a hot breakfast when all of the women were fasting and could only eat cold roti (chapatis). Amita jokingly told him that he should just have the cold roti, and he became very upset. After Amita angrily told him to grow up if he couldn't take a joke, the brother-in-law stormed off without eating breakfast. I now quote from the final paragraph of the story.

> Saying this Amita looked over to her sister-in-law and her mother-in-law for support. She thought that her mother-in-law would scold him for getting so angry about such a small matter, but who knew how many untold complaints were written on her expressionless face. She thought that her mother-in-law was reliving some old event in her mind. The sister-in-law put her head down and kept on eating. In Amita's loneliness her heart felt as dry and heavy as the flour in the rotis.

One of the points that Saraogi is making here is to show the loneliness of Amita which results from her resistance to the codes of womanly behaviour which both her mother-in-law and her sister-in-law promoted. The sister-in-law, after all, was jealous of the close joking relationship which Amita shared with her husband. Her mother-in-law and her sister-in-law do not join her in a sisterly alliance against patriarchal norms. Instead Amita's behaviour at least temporarily alienates her from everyone else in the family. For Amita, the experience of negotiating modernity became a prison sentence of emotional isolation.

I do not relate these two stories to suggest that Saraogi's community milieu is more patriarchal and oppressive than the average family in Bengal. What is interesting about her approach, however, is in how Saraogi depicts the production of sentiment in conjunction with an engagement with both feminist values and history. Rather than attempting to promote specific changes in women's lifestyles, Saraogi attempts to articulate the emotional turmoil of a young woman who seeks to make subtle but significant changes in the practices of their domestic lives. By portraying an engagement of micro-practices of feminist 'social reform' within the intimate site of the household, Saraogi sensitively captures the nuances of emotional distance, and deep resentment, which go along with the challenges to patriarchal familial authority.

The two stories that I examine here confront themes of the empowering uses

relationships, while also examining the predicaments implicit in the changing values found in modern conjugal relationships. At the same time that these stories question the relevance of male viewpoints in reflecting women's experience, they also raise questions about the predicaments of modern feminism for women living in kinship networks and family life. The stories do not just sentimentalise the intergenerational relationship. They document a complex set of intergenerational and gendered relationships. The importance of relying on the support of the grandmother, and in the second story the mother-in-law, allows the practice of everyday feminism to have a relationship of positive effect with the past, and can draw upon it for strength. In this sense, tradition is not so separate from modernity.

There is a critique of patriarchy in Saraogi and many other women's writing, focusing on sentiments of her character's hurt and disappointment in their internal life. For Saraogi, social reform, or social change, does not necessarily imply revolutionary

the march to the modern. There are more subtle tropes employed here, of compromise, hurting, accommodation, and resistance, and not just revolutionary acts, which determine how social arenas – such as the family – are changed. I do not claim that this aspect of Saraogi's work is necessarily unique. But what I find particularly suggestive, however, is the way that the accommodation of change does not belong to merely the youngest generation who throws out the past. The generations effecting change are linked with the past, in the figure of the grandmother, who despite being old is not irrelevant in the formation of the new.

Within Saraogi's stories, we can see the work of sentiments as practised in kinship, breaking down the distinction between modernity and tradition. This production of sentiment, I argue, is fundamentally concerned with articulating the presence of the past in effecting social change. The conversion of the past into memories of affect in these stories pluralises feminism in that it seeks to effect gendered and patriarchal practices without necessarily

The way that this writing allows us to hold onto the past is empowering in that it serves as a source of sustenance for effecting change for the present.

Notes

1 Kirin Narayan (1994) has been inspirational in this regard.

2 Harish Trivedi (1998) has contended that Saraogi's work, like most writers, is essentially written for literary critics, and is not necessarily meant for a much larger and imagined reading public.

3 I might add here that the translations from the Hindi originals are my own, done in consultation with the author.

Investment in Agriculture and the Globalisation Syndrome

N A Mujumdar

Studies in Agricultural Investments and Rural Savings by B D Dhawan; Commonwealth Publishers, New Delhi, 1998; pp 236, Rs 425.

IN the current euphoria about liberalisation and globalisation of the Indian economy, the agricultural sector has taken a back-seat. Or have 10 successive good monsoons made policy-makers complacent about agricultural growth prospects and food security? The *Economic Survey 1995-96* was distinctly upbeat about the outlook for foodgrains production: "Rice and wheat are emerging as major export products. Quantitative ceiling and minimum export price in respect of rice have been abolished. To further enhance exports Food Corporation of India has been permitted to export/sell for export 3 million tonnes of fine/superfine varieties of rice. Export of wheat up to 2.5 million tonnes in case of non-durum wheat and 0.5 million tonnes in case of durum wheat has also been permitted" (p 41). This illusion of surplus in 1995-96 was shattered by the end of 1996 itself and we had to import 2 million tonnes of wheat on an emergency basis. Even the logistics of importing such a large quantity in a short span of time were formidable. Public sector investment in agriculture in real terms declined from Rs 1,796 crore (at 1980-81 prices) to Rs 1,154 crore in 1990-91 and this decline continued for the next three years. Simultaneously, public sector banks consistently defaulted on the priority sector credit target of 40 per cent of net bank credit as also on the sub-target of credit to agriculture of 18 per cent. The share of priority sector advances declined from 41 per cent before 1990-91 to some 37 per cent in 1995-96. The Reserve Bank of India not only winked at these defaults but also put the overhauling of the moribund rural credit delivery system on the back-burner. The neglect of the agricultural sector by policy-makers was thus complete.

It is against this background that B D Dhawan's collection of eight research papers included in this volume needs to be appreciated. We need many more Dhawans to din into the ears of policy-makers the critical importance of the agricultural sector to the growth of the Indian economy, notwithstanding the globalisation syndrome.

Dhawan marshals statistical data to prove that the annual rate of growth of fixed investment in agriculture – that is, investment in agricultural machinery, farm implements, irrigation works, land improvements, etc – in real terms was negative during the 1980s, in contrast to a positive rate of 5 to 6 per cent recorded during the earlier period. More disturbing is the finding that fixed farm investment by the public sector declined at the rate of 3 per cent per year during the 1980s, in sharp contrast to the growth rate of 7 per cent recorded during the 1970s. Preliminary estimates for the 1990s indicate that this downward slide has been arrested but there are no signs of an upward swing.

The main theme of Dhawan's papers is that in agriculture public investment stimulates private investment. In fact canal irrigation and private capital formation in agriculture are well correlated (r = 0.65). More specifically, the elasticity of private fixed capital formation in agriculture with respect to canal irrigated areas is of the order of 0.25. The bulk of public investments in Indian agriculture are for the purpose of development of the irrigation infrastructure. Since nearly three-fourths of the irrigated area is devoted to production of foodgrains by farmers, public investments in irrigation are determined, *inter alia*, by the government's concern about food security.

The perception of governments – both the centre and the states – about food security must now change. More recent studies have warned about the impending rice crisis in Asia. The world rice market is relatively small and hence even if India has adequate foreign exchange, it may not be able to import the quantities of rice required in times of crop failures. In addition to food security considerations, there are several macro-economic reasons why the agricultural sector should continue to receive priority in the future strategies of growth. The ratio of dependence on agriculture has not declined, although the share of agriculture in GDP has declined from some 60 per cent in the 1950s to about 30 per cent in the 1990s. Moreover, a 4 per cent growth in the agricultural sector alone can facilitate the attainment and sustainability of a 7 per cent growth in overall GDP. It would have greatly enhanced the value of Dhawan's study if these macro parameters were also encompassed in his competent research papers. In any case one hopes that this study will have a salutary impact on policy-makers.

In terms of determinants of public investment in agriculture, Dhawan emphasises three factors. First, net borrowings of the state; second, financial surpluses emerging in the revenue account of state budgets; and third, relative share of the agricultural sector in total fixed capital formation in the Indian economy on public account. The third factor reflects, according to Dhawan, government 'preference' for agricultural investment *vis-a-vis* investment in other sectors. The reviewer, for one, would demur. Whatever may have been the empirical evidence, in the post-1991 phase it is governance, both at the government and banks/financial institutions levels, that has affected the flow of resources to the rural sector. I have dwelt with this theme at length in this journal (*Economic and Political Weekly*, November 21, 1998). Even in March 1998, advances by public sector banks were less than 16 per cent of net bank credit, as against the target of 18 per cent. There is a mountain of liquidity accumulating with the banking system but the mindset of bankers is preventing its flow to the agricultural sector even up to the targeted level. A more conspicuous example, directly relevant for the present purpose, is the Rural Infrastructure Development Fund (RIDF) which was constituted at NABARD in April 1995 with a corpus of Rs 2,000 crore for giving loans to state governments and state-owned corporations for quick completion of ongoing projects relating to medium and minor irrigation, soil conservation, watershed management, and other forms of rural infrastructure. Subsequently, RIDF II and RIDF III were established during 1996-97 and 1997-98, each with a corpus of Rs 2,500 crore. The union budget for 1998-99 made an enhanced allocation of Rs 3,000 crore for RIDF IV. While thus ample resources are available what is the record of their utilisation? The data provided by the Reserve Bank of India show that the performance in respect of utilisation is dismal: for instance, in 1996-97 utilisation was lower than 50 per cent and in 1997-98 utilisation slipped even lower to only 10 per cent. Could there be a better example of lack of governance, both at the state governments and the institutions levels? Projects are languishing not because

of lack of resources *per se* but because of our ineptitude in making optimal use of available resources.

Be that as it may, Dhawan deserves to be congratulated for producing this scholarly treatise which provides valuable insights into the processes of saving and investment in the farm sector.

UP Politics through Marxist Lens

Anirudh Deshpande

Quest for Power: Oppositional Movements and Post-Congress Politics in Uttar Pradesh by Zoya Hasan; OUP, Delhi, 1998; pp 280, Rs 445 (hardback edition).

THERE are certain trans-historical generalisations which are necessary for the construction of social science. For instance, the model of dialectical materialism suggests that historical change is predicated upon social contradiction. The struggle for power and hegemony is central to this holistic formulation. Historical materialism also asserts that a mode of production changes primarily because of the contradiction between its relations and forces of production. Hence, from the Marxist viewpoint, social contradiction, systemic change and questions of power comprise a staple for the social sciences. It is easy to locate Hasan's synthesis of political science, political economy and history in the Marxist tradition. But why choose a 'cow belt' state to test the Marxist theory of class-caste struggle in India? The answer to this underlines the specificity of the author's project. Uttar Pradesh (UP) cannot be ignored by any serious discussion of Indian politics because the magnitude of "political changes in UP have profoundly affected political discourse on a national scale" (p 218). UP has obviously been selected for the following reasons. Firstly, because it was the epicentre of centrist politics till the 1970s, and the decline of the Congress in it symbolises the nationwide decline of centrism. This eclipse, despite the recently held September Panchmarhi conclave, appears more than transient. Secondly, the social manifestation of economic change, and its translation into a class-caste power struggle, is well documented and clearly visible in UP. And finally, at least in the short run, hindutva has apparently triumphed over Mandal in UP. In the long run what happens to the Sangh parivar-BJP nexus in UP could well decide the future of hindutva in the rest of the country.

The book comprises six chapters including an elegant introduction and a concluding note called, 'Interpreting Political Change'. The 'Introduction' contextualises the author's problematic by claiming that hitherto political scientists have generally paid less attention to the 'non-institutional processes' like class, caste or community in their analyses of social change. However, to account for these categories and the 'non-party movements' in India political scientists are advised to understand the segmentary character of Indian society and its politics based on social cleavages. This is crucial for political science primarily because the Indian state, the subject of Indian political scientists, assists the politics of differences. This happens because the state, by virtue of being an organisation of the ruling elite, "can more easily deal with the demands for more resources or jobs raised by non-class ethnic politics, than the structural changes implicit in the demands made by radical class movements" (p 3). But this "drama of social and political change in contemporary UP" is not merely about political science or the changes necessary to make it sociologically dynamic. It deals with the cardinal concerns of political science by offering the reader an enjoyable and sensible mix of politics, economics, sociology and history.

The 'Introduction' points towards all this by focusing sharply on the salient features of UP's contemporary history. Our attention is drawn to (a) the decline and decimation of the Congress in UP, (b) the changing nature of the state and oppositional movements in UP and the emergence of hindutva as a major political force and (c) the problems of the intermediate castes like the jats, lower castes like the OBCs and the dalits and their conflict with the brahmanical order supported by the right wing Congress leaders. Beside this, the class-caste nature of UP politics is defined with reference to the near absence of an urban bourgeoisie in the state. Politics in UP, we are told, is dominated by a well spread, narrow minded and largely Hindi speaking lower middle class which dominates the small towns and cities of this economically backward state. These factors combined with the emphasis on uneven development, industrial and educational backwardness and the broad failure of the relations of production and power to accommodate the growth of new socio-political forces in UP introduce a promising Marxist model. However, the comprehensive Introduction does not answer two important questions. The first is about the BJP. We do not know whether the BJP wants to change the nature of the Indian state or gain power and work within it. The second is about the petty bourgeois nature of communalism in India. This is problematic because the BJP and its allies have also come to power in industrially more advanced states like Maharashtra and Gujarat. What role has big business played in the emergence of majoritarian communal alliances in these states?

Chapter one, 'Social Conflict and Political Discontent: The Historic Decline of the Congress', maps the central problematic of the book. Right from 1947 the Congress contained the secular-liberal, socialist and conservative-Hindu strains and historians would argue that these contradictions were a legacy of the freedom movement. It is well known that in UP the upper caste dominated conservative-Hindu group triumphed at the cost of the Congress centrists and socialists. This led to the dilution of the Nehruvian project in UP, the ultimate ghettoisation of Muslims, the practical neglect of the dalits and the dominance of 'status quoist' leaders like G B Pant, Sampurnanand and C B Gupta over the party apparatus. In Hasan's view this happened largely because of the communal effect of the partition and the transformation of the Congress from a party of movement to a party of government. This meant that democratic dissent, reflective of non-conservative ideology and social groups, could find political expression in UP only outside the Congress Party. As a consequence, by 1967, a number of anti-Congress forces had appeared on the political scene in UP to seriously challenge the upper castes who were ruling the state in the name of Congress centrism. But why could the secular and left inclined Nehru not anticipate and pre-empt the domination of the UP Congress by the Hindu reactionaries given the fact that the Congress was a highly centralised party and Nehru's prestige in it was immense?

The upper caste Congress leadership, in general, failed to comprehend the growing importance of the socio-economic forces which were producing these anti-Congress formations in UP. The 1947-67 period was characterised by the growth of a new rural elite comprising the middle castes like the jats led by Charan Singh and the better known OBCs often organised by the Lohia socialists. These castes, often as long standing tenants of the feudal and absentee landlords, owed their rise to the first stage of land reforms called zamindari abolition. On the other hand, discontent kept rising unchecked in the urban petty bourgeoisie as a consequence of insufficient industrialisation, soaring prices and unemployment. But the Congress leadership tried to deal with these developments by

continuously relying on a coalition of brahmins, Muslims and scheduled castes. By the end of the 1960s the upper caste-classes were coming under tremendous pressure from the newly ascendant groups on all the socio-political fronts. This happened despite the left-populist measures taken by Indira Gandhi in 1969 like the nationalisation of banks and abolition of the privy purses. In the meantime, the party became authoritarian and over-centralised under Nehru's daughter and hence incapable of coming to grips with the new ground realities in UP. The failure of the Congress to evolve a KHAM (kshatriya, harijan, adivasi plus Muslim) type strategy in UP was predicated upon the unchanging nature of the party in UP under the central leadership of the Nehru-Gandhi family. This assertion will help revise the opinion, prevalent among sections of the left and some old Congressmen, that the party's slide in UP began after Indira Gandhi assumed control over it in the late 1960s.

While the socio-economic conditions in the 1960s in UP, as in the rest of the country, deteriorated, their political manifestations assumed alarming proportions in the 1970s and the 1980s. Certainly, at the subaltern levels of society, change was occurring although the political class and a corpulent administration were insensitive to it. In the rural areas the dalits were becoming more assertive and the upper and backward castes were trying their best to suppress them. As the movement for the abolition of begar and minimum wages grew, violence erupted in the countryside on a large scale. Communal violence also escalated as the ruling classes tried to divert popular attention from the real causes of discontent. In the 1970s a Muslim entrepreneurial class, helped by the Gulf boom, began to make its presence felt in the towns of UP. This directly threatened Hindu trading interests and their traditional links with the Muslim artisans. The consequence was a sharp increase in communalism and communal riots. But the government, instead of addressing the real issues in the state, made matters worse by using the highly partisan PAC to teach the Muslims a lesson. Things did not change even during the days of a so-called modernist like Rajiv Gandhi who received a massive mandate in 1984. Indeed much before the rise of Mulayam Singh Yadav, violence had "become a way of life" in India's most populous and agrarian state. These class, caste and communal conflicts were caused and nourished by the extreme economic backwardness of the state and the monopoly exercised over state power by the upper caste elite. These crucial historical indicators find painstaking statistical corroboration and empirical documentation in Hasan's sumptuous narrative which debunks the long-held 'savarna' myth that the administrative decay in UP was caused by the policy of reservation. Finally, the stunning defeat of the Congress in 1989 exposed the short-sightedness "of running with the hare and hunting with the hounds".

In the 1970s and the 1980s as the Congress decline continued virtually unchecked, oppositional politics were being forged firstly by those social groups which developed a close relationship with the process of land reform in the state. Many of these groups wanted a larger share of state power for obvious reasons but found their way blocked by the Congress inclined upper-caste/upper-class elite. Which social segments comprised these groups? What were the issues on which they organised anti-Congress political movements? And what was the consequence of these movements? These important questions of Indian social history are answered in chapter three and four of the book. Chapter three, 'Agrarian Change and Rural Unrest: Farmers in the Forefront', critically surveys the land reform process in UP and the emergence of the jat peasantry as a significant section of the rural "surplus producers", i e, the "agrarian bourgeoisie" enjoying subsidies, tax concessions and the benefits of the green revolution.

The Congress tried to counter the growing influence of these peasant proprietors by trying to marshal the support of the rural poor but the failure of distributing surplus land put paid to these half-hearted attempts. Since the Congress leaders were often the worst enemies of land reform, the party ultimately became unpopular among the peasants as well as the rural poor including the marginal peasants and landless labourers. In short, by the late 1970s, as a consequence of zamindari abolition and the green revolution, a powerful rural bloc dominated by the middle and backward castes had emerged in large parts of UP. Led by men like Charan Singh in the late 1960s and 1970s and Mahendra Singh Tikait in the 1980s, these "surplus producers" of western UP gradually demolished the Congress in UP. However, the battle for power between the Congress and the farmers was a matter of class and caste realities as well as hegemonistic perceptions. The author has highlighted this fact by carrying out an appropriate class analysis of the peasant proprietor bloc. Although agriculture had not suffered in UP under Congress rule, and ironically the farmers had been produced largely by the Congress policies, it was advantageous for the new rural elite to paint it in dark shades. The perception that the Congress was pro-urban, pro-industry, anti-rural and stood for India *vis-a-vis* Bharat, was crucial to the consolidation of the rural bourgeoisie as an influential pressure group at the centre and in several states. But actually the farmers movement was deeply "class driven" and sensitive to caste issues which characterise the agrarian relations of production in India. That is why Tikait's movement, which excluded the landless rural poor, ultimately swung in favour of the BJP against the temporary coalition of social justice and rising dalit consciousness forged by leaders like V P Singh, Mulayam Singh Yadav and Kanshi Ram.

While the farmers were articulating their desire for power in western UP, in central and eastern UP, the OBCs (yadavs, kurmis, keoris and lodhs) and dalits began to assert themselves as important electoral and pressure groups. According to Hasan, backward caste and dalit mobility was predicated upon their social reform movements of the pre-independence period. But surely the second world war helped many OBC tenants by raising food and milk prices, and similar trends, mentioned elsewhere in the volume, continued after independence due to increasing population and urbanisation. Nonetheless by the 1960s and 1970s an elite among the OBCs had already crystallised. The story of the "combination of democracy and demography" is narrated in a remarkable overview of the politicisation of caste in chapter four aptly titled 'OBCs and Competitive Mobilisation: Recasting the Political Order'. There are some generalisations in this chapter about the caste-class system in UP worth noticing and the limitations of caste politics appear in the Marxist language of development economics. "Theories of social justice", we are told, "never involve redistribution of ownership of the means of production and private wealth or progressive taxation...caste pride and self-respect cannot go very far without roads and development...(and) in the absence of an alternative class politics or regional politics, the denting of upper caste dominance does not denote the victory of subordinate castes and classes" (p 163-65).

Understanding the caste-class structure and upper caste domination in UP is important to grasp the complex nature of OBC and dalit politics in the state. There are 42 per cent OBCs, 21 per cent scheduled castes, 16 per cent Muslims and 20 per cent upper castes in UP's population. But despite this break up, the upper castes form a cohesive 'ashraf' class against a large majority of the internally divided 'razil' class. These intra-OBC divisions have helped the BJP carry a substantial

section of the backward castes from the Mandal to mandir platform in the wake of the Congress decline. In 1947 the equation was as follows. The upper castes formed the sharif, upper class and educated elite whereas the lower castes comprised the razil, labouring, largely uneducated and tenant groups. In the 40 years since independence, the "hegemonic hold of the upper castes was more or less broken" in UP as a vocal section of the backward castes and dalits successfully raised the level of reservations in government jobs. But why was Mandal so obviously highlighted in UP? That is so because in an industrially backward state like UP the bureaucracy is an employment and privilege generating machine, and government jobs comprise the best avenue for a growing army of OBC graduates. It is rightly pointed out by the author that the purpose of reservation is a reduction in the traditional upper caste control of the state which is the chief vehicle of power, connections, upward mobility and ultimate hegemony in Indian society. However, reservation can also be viewed in the light of the changing nature of the ruling class despite the violence it has periodically provoked. It is also an attempt by the ruling class to perpetuate and broaden itself, and prolong bourgeois democracy, by co-opting pontentially rebellious groups.

In the context of the chapters reviewed above how can the rise of the hindutva forces in UP be finally explained and narrated? Chapter five, 'Ayodhya Movement and the Politics of Communal Compromise: The Struggle to Control Uttar Pradesh' and the concluding note do precisely this. Firstly, the decline of the Congress and its long-term policy of pragmatic communalism proved decisive in shifting upper caste-class loyalties to the programmatic communalism of the BJP. Secondly, the simultaneous rise of the OBCs, dalits and their potential alliance with the Muslims threatened the mythical unity of Hindu society favoured by the savarna castes led by the numerically and socially powerful brahmins in UP. This provoked a strong rearguard action among the cohesive upper castes of UP who, unlike their brethren in south India, chose to fight in the political battlefield under the saffron standard. But the roots of Hindu-Muslim communalism in UP are deeper and go behind the explosive mandir-masjid days to the unfortunate Hindi-Urdu controversy raised by a narrow minded and provincial intelligentsia and fanned by a Hindi-chauvinist regional press. This enhanced communal consciousness, distorted history, artificially divided the composite Hindustani language and culture and, sadly enough, completed the agenda of partition in democratic India. This helped create the "historical and political conjuncture" in India grasped by the communal forces in the 1980s and 1990s with the "specific project of capturing state power and remaking India politically and ideologically" (p 189).

Contemporary UP, like the rest of India, is passing through a transition reflected in its politics of caste and class analysed by Hasan's well-researched book. This kind of politics uses parliamentary democracy to good effect but simultaneously its potential to usher in progressive social change is limited. Its terms of reference appear self-limiting. The future, in the context of a fractured mandate produced by a politics of difference, seems predicated upon the ability of adversaries to exploit the differences in the opposition's alliance. For quite some time the political pendulum will swing from one coalition to another as alliances are constituted and reconstituted. At the moment the Congress is a spent force and its future in UP appears uncertain. There are important schisms in the hindutva and anti-hindutva political formations although temporarily the BJP has an edge over its rivals. However, if the state does not industrialise soon, the BJP might suffer the same fate as the Congress and new political equations might arise in future.

State Government Subsidies

The Case of Tamil Nadu

S Ambirajan

Competitive populism of political parties has led to a distortion of the subsidy system in India. This article examines the nature, causes and consequences of the growth of subsidies in Tamil Nadu. Any study of subsidies has to take into account the political economy of their structure and functioning. Besides statistics, there is qualitative evidence to show that the subsidy system in Tamil Nadu is wasteful, corrupt, regressive and counter-productive. The two major political parties are locked in an unhealthy Nash equilibrium of inefficient populism.

Valavan aayinum alavu arindu azhitthu, unn.
(Though you are as wealthy as the Cholas, spend to the extent of your income.)
– Avvaiyar in *Konraiventhan*

I
Introduction

THE subject of subsidies has become highly controversial in recent years. During the present era of liberalisation, globalisation, privatisation and economic reforms where the main policy thrust seems to be to downsize the role of government in the functioning of the economy, one need not be surprised at the attention given to the subsidy issue. While superficially 'subsidy' appears simple enough, any analysis of its philosophy, politics, economics and measurement bristles with difficulties. In the literature of public finance, the study of subsidies occupies a significant place because it is part of the key area of public expenditure analysis.

It is agreed that a prime function of government is to collect taxes in order to spend on public or collective goods that are made available to all, and indeed no one could be excluded from receiving the benefits from them. There are other areas where government needs to use the tools of taxation and expenditure. Both equity and efficiency considerations require state intervention. While the former aims at redistributing wealth and income to bring about an equitable economic society, the latter relates to the need for preventing distortions that emerge as a result of externalities. Externalities arise as a consequence of the divergence between social and private costs or benefits. Government takes action by imposing appropriate taxes or subsidies to equalise private and social valuations. In an ideal society where all costs and benefits can be internalised by the economic agents and where an ideal distribution of income is present, neither taxes nor subsidies need be present. But it is not so in real life situations. By interfering in the market, taxes and subsidies tend to distort the way resources are allocated. Subsidies, depending upon whether they are for positive or negative reasons, induce people to produce (and consume) more or less of those goods and services. Thus a positive subsidy induces people to consume services that are valued at less than their cost – and hence it is inefficient. If however, there were positive externalities associated with these subsidised goods and services, the subsidy has the effect of enhancing efficiency.

The standard neo-classical static economic theory as given in our micro-economics textbooks is clear. Assume that the demand for a particular type of service is D_h (Figure 1). Assume that it is supplied at a price of P_h. This measures the marginal social cost of producing those services and we are assuming that the marginal social cost is constant. Equilibrium supply is Q_1. The government decides to provide a subsidy of s per cent to the producers which makes the new price $(1-s)P_h$ and the supply curve becomes S'_h. Naturally, the quantity consumed goes up as a result of reduced price to Q_2. It has thus increased the consumption of the services. But what about efficiency?

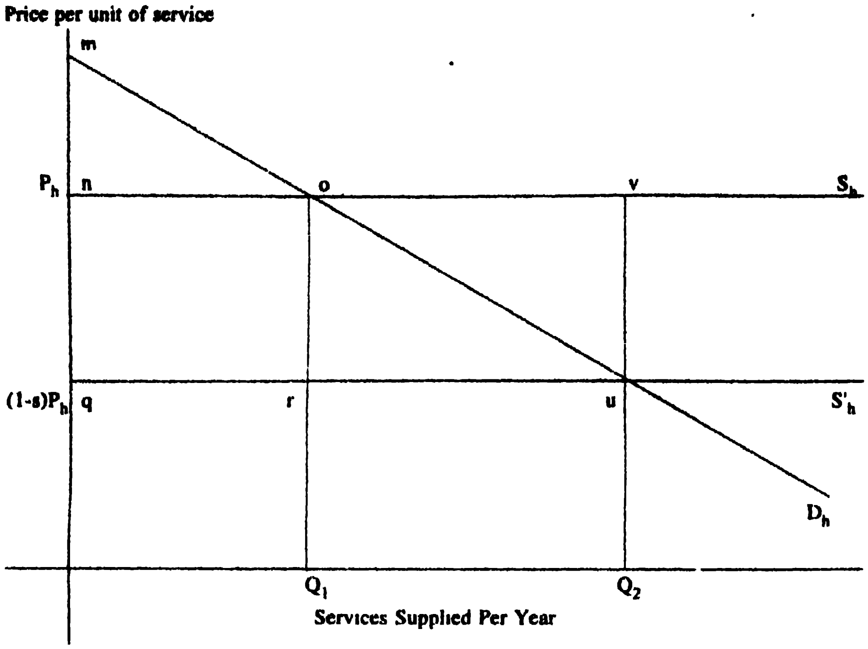
Originally the consumers' surplus was mno. With subsidy it is mqu. Consumers of the services get nouq more surplus. The cost at which this benefit is secured is clear. The cost of the subsidy regime is the quantity of the services utilised, qu multiplied by the subsidy price per unit nq or rectangle nvuq. Thus the cost of the subsidy exceeds the benefit – an excess burden ovu caused by the difference between nvuq and nouq.

We are assuming that the funds for subsidy are raised through lump sum taxes. If that is not the case, there will be even more of an excess burden We also assume that all the benefits accrue to the recipients with nil administrative costs.

Economic inefficiency arises because the subsidy regime masks the value people assign to particular level of consumption. To the right of Q_1, although people derive utility from consuming more, its value is less than P_h the marginal cost to society providing it. In short, inefficiency is increased because the subsidy encourages people to utilise more of the subsidised services that are now valued at less than their cost. Two interesting considerations follow: (a) the marginal rate of substitution (MRS) after subsidy depends on $(1-s)P_h$ while the marginal rate of transformation (MRT) in production depends on P_h. Thus when MRS is not equal to MRT allocation of resources cannot be efficient. But of course if there is a positive externality associated, a subsidy will enhance efficiency. And (b) the same increase in welfare could be generated by a direct grant to the needy because less money could raise them to the same utility level as the rest. In other words why subsidise people consuming Q_1 who were earlier happy to pay the price of P_h?

Subsidies are of three kinds: (a) those that help in increasing production or consumption of goods and services, e g, education, food; (b) those that help to increase the use of particular factors of production, e g, fertiliser; and (c) those that are special purpose subsidies to achieve some broad social objective, e g, export subsidies. There are also negative-tax type of subsidies provided basically to desist from undertaking certain kinds of productive activity as for example the subsidies given to the American farm sector to curtail production with the intention of maintaining prices at a higher level. Subsidies could be explicit with an actual flow of funds from the government to the private sector; or they could be hidden where the flow can only be imputed as in the case

FIGURE 1: NEO-CLASSICAL STATIC ANALYSIS OF SUBSIDY



of special tax concessions or loan guarantees. In many instances, a subsidy may not flow from the public to the private sector, but from one section of private sector to another. This form of cross subsidisation occurs when some consumers are charged higher prices to enable other consumers to pay lower prices. There are many situations when unintended subsidies exist because of the sheer mismanagement of public resources that results in a flow of resources from the public to the private sector. Subsidies are not given for a consideration although it is conditioned on some particular economic performance such as to grow more oilseeds or consume more educational services. Hence it is necessary to distinguish them from welfare payments like old-age pension or medical care for the destitute.

The classification of goods from the perspective of subsidies is not without problems, and it is doubtful whether one can entirely avoid subjective value judgments in evaluating which goods produce externalities and which do not. For example, in a discussion paper issued by the ministry of finance, government of India, 'Government Subsidies in India' (May 1997), goods and services are classified as public, merit and non-merit which is straightforward. However, the externality condition the paper assigns to particular items included in each of these categories can be questioned. When a statement such as "Education beyond the elementary level falls outside the ambit of merit category" it cannot be anything other than the subjective evaluation of the author of the paper.

II
Statistics

A significant feature of Indian public finance since India became independent is its pro-active nature. From the beginning, there existed a consensus that the government will actively use its fiscal tools to improve the efficiency and equity of the Indian economic system. With the steady expansion of the economic activities of the government, the part played by subsidies also widened. During the period since 1971 explicit subsidies provided for by the central government have gone up by no less than 120 times. The total sum of explicit subsidies has gone up from Rs 140 crore in 1971-72 to Rs 19,644 crore in 1997-98 (RE). Although there is some consolation that as a proportion of GDP, it has fallen (from 2.3 per cent in 1990-91 to around 1.4 per cent in 1997-98), in absolute numbers the growth has been quite substantial. Bulk of this has been in the areas of food, fertiliser, railways and interest payments. While the average growth rate of this increase is approximately 20 per cent in current rupees, in real terms (at 1980-81 prices) it is around 10 per cent per annum. Even during the 1990s when the government of India undertook to reform the Indian economy, the amount spent on subsidies not only did not abate, but actually registered a substantial increase. The state governments too have been liberal in their subsidy regime during this period though the experiences of the states differ. The state governments on the whole spend a much larger proportion of their receipts on subsidies because according to the Constitution of India, developmental and social welfare activities are vested with the state governments. A great many of the goods and services produced for stimulating the development of the state economy will not be forthcoming via the unrestricted market mechanism because of the presence of externalities. While a certain proportion of these goods and services are purely 'public' in nature, a large part of them fall under the 'merit' and 'non-merit' category. In this article, an attempt will be made to examine the nature, causes, and consequences of the growth of subsidies in Tamil Nadu.

'Subsidies' are an economic category and though we can define it precisely for analytical purposes, computation of the actual subsidies is difficult under the most easy circumstances where the processes of public finances are transparent. State finances in India are not only complicated but also opaque. The statistical systems are primitive, and one cannot easily fathom the reasons for the way certain accounts are kept. Even when data is made available, it is difficult to make sense of them. The problems get compounded when an attempt is made to examine their evolution over time using time series, or to make a comparison spatially with other states in India or other countries. Historical reasons, political compulsions, administrative exigencies not to mention sheer statistical incompetence make a study of subsidies a baffling and tentative exercise. Despite all these caveats, Tamil Nadu is perhaps marginally better than other states because at least gross data is made available and the department of evaluation and applied research has been reworking the state finance statistics to provide an economic and functional classification.

A most significant aspect of Tamil Nadu public finance is the phenomenal increase

TABLE 1: SUBSIDIES IN FINAL NET OUTLAYS

(Rs crore)

1960-65	5.09
1965-70	28.36
1970-75	54.34
1975-80	54.41
1980-85	387.53
1985-86	146.21
1986-87	182.60
1987-88	501.34
1988-89	468.59
1989-90	734.73
1990-91	706.34
1991-92	2848.12
1992-93	1986.99
1993-94 (RE)	1158.51
1994-95 (BE)	1138.88

in the proportion of subsidies in the budget during the 1980s and 1990s. Even during the earlier period, subsidies tended to follow the election cycle, but after 1980s, it is a continuous and relentless rise. Table 1 represent what is defined as subsidies and not the actual extent of subsidies in terms of what an economist will understand by that term.

The subsidies cover numerous areas in economic, social and general services. They cover a wide range of beneficiaries – agriculturists, capitalists, consumers, policemen, school-going children, depressed castes, rural poor and so on. As we can see the subsidies have been increasing rather steeply, and there is hardly any doubt that once the final accounts appear for the years 1993-94 onwards, we would witness much higher figures.

Over the period subsidies as a proportion of total current expenditure have also has been increasing. From around 7.61 per cent in 1983-84, the share went up to 38.09 per cent in 1991-92 and settled down to 27.95 per cent in the next year. Though it seemed to show a decrease in the next two years, the correct magnitude will be known only when the final accounts for those years are available. The trend is unmistakable. Subsidy as a proportion of total current expenditure was 12.96 per cent during 1980-90 period and it has gone up to 22.96 per cent during the 1990-95 quinquennium.

Even more than the increase in direct subsidies, indirect subsidies also show substantial and unhealthy increases during the last two decades. The extent of the indirect and hidden subsidies in the various governmental activities can be seen in the low level of non-tax revenues (Table 2).

In general, the Tamil Nadu government enterprises function in such a manner that they absorb more than they deliver. To give the instance of receipts in respect of dividends from enterprises, they averaged a mere Rs 1.37 crore per annum during 1980-85. Even subsequently, despite substantial investments, the growth has been meagre as can be seen from Table 3.

The situation is still worse if we take the departmental enterprises producing tradeable goods and services under the heads of irrigation, road transport, forest, chincona plantations, milk supply schemes, printing press and agricultural engineering (Table 4).

There is thus ample evidence that the component of subsidies has been increasing enormously, and on the whole the items under the head of 'economic services' such as agriculture, forestry, fishing, mining, manufacturing, construction, electricity, water supply, transport and communications, receive the bulk of subsidies. The bulk of what remains go to 'social and community services' that includes education, health, etc, (Table 5).

As we pointed out earlier, these figures represent subsidies as defined by the department of evaluation and applied research which contains: (a) grants on current account made to private industries either as direct payments for the producers or as differentials between the selling and buying prices of public sector trading organisations; (b) grants made to public sector corporations to compensate for losses as a consequence of government policy to maintain a stable price level; (c) rebates on the sale of handloom cloth, loss on the sale of fertilisers, improved seeds, pesticides and agricultural implements; (d) grants to co-operative societies to make good their losses for them to continue in operation; and (e) loss in irrigation services.

What these figures do not include is considerable. In their definition, it is stated clearly that current grants to private non-profit organisations, service households and local bodies are treated as 'transfers' and excluded from subsidies. Though technically transfers, lump sum gifts made to marriageable girls of certain castes under Moovalur Ramamritam Ammaiyar Scheme are really subsidies to acquire husbands. Surely when non-profit organisations and local bodies supply goods and services below their actual cost, they are subsidies. Similarly, all the expenses incurred in the MGR nutritious noon meals scheme except the subsidy element embedded in the TNCSC are not captured in the above subsidy figure. There is a very strong subsidy element in the provisioning for education, water supply, health and hygiene services because of the costs incurred and recoveries made. The losses on account of both departmental commercial undertakings and the non-departmental public corporations do not fully come into the subsidy calculations

because of the complicated nature of accounting adopted by all agencies. One main reason for such underestimation is the interest differential. The government lends capital, especially to the Tamil Nadu electricity board, public sector enterprises, statutory bodies, local bodies, co-operative societies, cultivators and government servants, at far lower rates than what is prevailing in the open market.

If we manage to take all these implicit subsidies into account, the subsidy figure will be far higher. Precise calculation of this figure is almost impossible with the sort of data availability and deficiencies that the analyst faces in such an exercise. It is possible to get another picture if we look at the difference between the total current costs and the gross recoveries effected as stated in the annual budget accounts. An attempt is made to look at the recovery rates (Table 6) in areas that could be classified as either merit goods or other services that public policy determines to be producing external economies and thus needing some support from the public funds.[1]

The recovery rates substantially overstate the real subsidy outgo because a few items in the list provide a high rate of recovery such as 'forestry and wildlife', 'non-ferrous metals', 'crop husbandry', and even 'interest payments' in certain years. If we decompose the above gross figures into 'merit goods' 'non-merit goods' as the discussion paper of the ministry of finance, 'Government Subsidies in India' (May 1997) does, and also omitting what is called 'surplus sectors: economic services', the recovery rate will dip substantially. However, even the seemingly steady recovery rate does conceal the steep increase in subsidies which can be observed if we take a few of the most important subsidy schemes (Table 7).

While there are many sectors that account for this substantial increase in the subsidy element, the two areas that are of key importance are food and power. The way they have moved over time indicate many of the basic problems that beset the state finances.

Food: This is probably the most vulnerable area of Tamil Nadu government's subsidy policy. Throughout the 1980s and 1990s, subsidy under this head has been rising and often very sharply.[2] The TN Civil Supplies Corporation (formed in 1972 and converted into a public limited company three years later) is vested with the following functions: (1) acting as a wholesale agent of the government to procure and distribute all commodities – rice, wheat, sugar and edible oil – with the *exception of kerosene; (2) running retail outlets; (3) taking delivery of central pool* allocations of rationed items from time to time; (4) supplying commodities to the various welfare schemes such as nutritious noon meal scheme in schools, Sri Lankan refugees, foodgrains for SC, ST, BC, MBC hostels; and (5) Making open market purchases.

The public distribution system (PDS) is a mammoth operation because it has under its control 24,905 fair price shops. The rules are framed precisely to help consumers such as for example there should be one shop for at least 800 family cards. This could be reduced to 500 cards under certain circumstances. Further there is a rule saying that "no cardholder is required to travel more than 2 kilometres". Again there are part time shops and mobile vans to cater to particular customers. For all this, it received Rs 1.81 crore subsidy in 1980-81 and this has grown to Rs 1,000 crore in 1997-98 as Table 8 shows.

The reason for this phenomenal rise is simple. The cost of procuring rice is much higher than the price at which it is sold. This differential has been growing steadily as Table 9 demonstrates. From hardly Rs 0.40 per kilo in 1979-80, it has reached Rs 6.35 last year. The quantum of subsidy depends not only upon this price differential but also upon the type of rice supplied, the method of obtaining it and the total distribution under the public distribution system. 'Common' variety is cheaper than 'A' and naturally poorer people prefer the common variety. There is supply from the central pool account to which must be added costs involved in transport, storage, rate of interest, which is the cost price for TNCSC. There is also parallel procurement locally (to meet the shortfall from the central pool allocation) where there are costs of purchase, milling, storage and so on. The government of India fixes the support price which is accepted by the state government though in order to provide an incentive for the Tamil Nadu farmers to produce further subsidies is given which are variously called 'incentives' (1991-93, 1996, 1997), 'transport charges' (1995) and 'incidental charges' (1997, 1998) ranging from Rs 10 per quintal in 1996 to Rs 50 in 1997. The offtake has grown from 1.35 tonnes in 1979-80 to 22.19 tonnes in 1996-97. It must be remembered that PDS coverage is 83 per cent of the population in Tamil Nadu as against the national average of 36 per cent.

Public Sector Undertakings: Another aspect of the Tamil Nadu economy where there is a substantial presence of subsidy is the way the 67 public sector undertakings (PSUs) are being managed. There is the Tamil Nadu Newsprint and Papers Limited, which is a deemed government company, and 18 co-operative spinning mills. We have earlier referred to the meagre income in respect of 'dividends from enterprises', but even that conceals the real burden on the exchequer. These undertakings are involved in passenger and other transport, mining, manufacturing, trading, developmental finance, agriculture, construction, and other miscellaneous and/or developmental activities. As on March 31, 1998, these 67 PSUs have around 1.61 lakh employees and a share capital of Rs 1,059.74 crore, and have borrowed Rs 4,204.50 crore with investment totalling Rs 5,272.90 crore.[3] It becomes clear when we examine their functioning that they are a drain on Tamil Nadu finances for share capital, loans and subsidies (Table 10).

When the annual budgetary provisions for the state PSUs are seen, we see nothing but a constant flow of funds from the exchequer to these entities for a variety of reasons such as 'loans', 'share capital' 'share capital assistance to maintain adequacy ratio', 'reimbursement of bus fares', 'to repay advances', 'conversion of outstanding loan, 'sales tax subsidy' or other subsidy. To give the example of TANSI, during the 1991-95 period, it has received either as sales tax subsidy, or for write off of loans a total sum of Rs 1,872.97 lakh. This is in addition to the write-off of 50 per cent accumulated interest charges amounting to Rs 730 lakh. The loan liability to the state stands at Rs 3,416.88 lakh. The story is not very different in the case of the 18 co-operative mills in which the TN government holds 93 per cent of the share capital. The accumulated losses as on March 31, 1997 were around Rs 221 crore.

Power: There can hardly be any doubt that power is a basic essential for efficient functioning of the economy. Though it is essentially a 'private' good, there are significant externalities associated with it, and governments deem it necessary to give support to its production in one way or another with considerable financial involvement through subsidising. In Tamil Nadu, government's presence in the energy – electricity – sector is enormous. The TNEB as the main, if not the only, provider of electricity in the state is the largest public enterprise in Tamil Nadu, and this has always been operating in the red requiring heavy subsidies. According to the Electricity (Supply) Act as amended in 1985, the TNEB should earn at least 3 per cent on its net fixed assets after making provision for depreciation and interest payments. This ratio averaged around 1 per cent in 1960s and dropped to –2.8 per cent in the next decade. Subsequently in the first half of the 1980s, it was –21.7 per cent.[4] In the 1990s, though TNEB has been able to meet its current costs out of current revenues, its continued operation requires substantial infusion of government subsidies to meet interest charges, depreciation provision and expansion of capacity.

As can be seen from Table 11, the finances of TNEB are not rosy, and the subsidy received is quite substantial. If a different kind of computation is tried, the figures could look worse. For example, not only are interest rates generally low for TNEB like other government undertakings, in terms of the statutes, loans (apart from ways and means advances) received from the government need not be repaid apart from interest charges. If depreciation were calculated on replacement basis instead of the book value method adopted at present, the deficits could be larger.

There are other areas where subsidisation is considerable and diffuse. Private sector industry receives subsidy in numerous ways such as backward area concession, investment subsidies related to fixed investments, sales tax exemption for specified number of years, and so on. Concessional tariffs on electricity are provided to industries set up in backward districts. More recently red carpet treatment is accorded to FDI no doubt involving considerable indirect subsidies. While subsidies benefit particular industrial units, computation of their total impact on the exchequer is beset with both measurement and data adequacy problems. The same is the case with irrigation subsidies. As can be seen in Appendix A the recovery rate under the heads, 'major and medium', 'minor', and 'command area development' is extremely modest.

As has often been pointed out, notwithstanding the strictures of Irrigation Commission (1972) and National Commission on Agriculture (1976) against subsidising irrigation, in Tamil Nadu, direct and indirect subsidies to irrigation are very steep.[5] The agricultural sector as such receives not only price subsidy and irrigation subsidy as we have already seen. It receives an enormous subsidy for power

consumed. The effective subsidy for agricultural consumers in Tamil Nadu defined as the difference between average unit cost of power and average unit of revenue realised is substantial as Table 12 indicates. In general, the Tamil Nadu agricultural sector has been well pampered by subsidies and this is not confined to the 1990s. Ashok Gulati has computed that input subsidies (power, irrigation, fertiliser and credit) as a percentage of state domestic product in agriculture over 1980-81 to 1986-87 was highest in India at 31.7 per cent whereas the all-India average was only 17 per cent.[6]

Besides these, there are a number of other fields such as education, health, public utilities, welfare of weaker sections, transport, and so on where government is deeply involved financially with very low recovery rate resulting in substantial subsidisation.

The long and short of it is that the 'subsidy' element in Tamil Nadu public finances has been growing quite substantially. Whether it is direct or indirect or whether it is a proportion of the total public expenditure, the result seems to be the same. While the gross budgetary subsidy as a ratio of the net state domestic product has fallen from 15.25 per cent in 1990-91 to 13.89 per cent in 1996-97, during the same period, per capita subsidy has gone up from around Rs 750 to approximately Rs 1,550. There are no signs that this rising trend is on the wane.

III
Impact

The question of subsidies in India in general and Tamil Nadu in particular raises many issues. Economic theoretic justifications of subsidies as in the textbooks mention only efficiency and equity considerations. The Constitution of India also lays down that governments should provide certain services at low or no cost. But in order for these objectives to be realised through subsidies, the requirement is a totally apolitical and honest system of administration which seems to be an impossibility. Any study of subsidies as they actually exist has of necessity to take into account the political economy of their structure and functioning (Appendix B). Who wields power over public resources? How do they utilise the power, and for whom, are relevant questions. It is also necessary to raise the question of how effectively the subsidies are able to achieve the stated objectives.

There is ample qualitative evidence to show that the subsidy system in Tamil Nadu is wasteful, corrupt, regressive, and counterproductive. Some of the big elements of the subsidy system are epitomes of inefficiency. Take for example the gargantuan food subsidy. From the time the items are procured to the time they are delivered to the consumer, one can witness the enormous mismanagement that results in the wanton destruction of scarce resources. *The Hindu* reported on October 28, 1998 that "A huge stock of about 15,000 tonnes of rice is virtually rotting in nine depots of the Food Corporation of India (FCI) in Tamil Nadu region for the last few months". As they could not dispose of the stock, it will be sold "as cattle-feed after two years as, by that time, it would become unfit for human consumption". Obviously better co-ordination between the centre and state could prevent this kind of wastage, but in our public sector ethos, this is an impossibility.

Another area where policy leads to wastage is in the power sector. When agriculturists are given free power, they tend to overuse it by retaining antiquated power-guzzling equipment. Corruption in public sector is widely known and every senior officer one talks to provide numerous instances of how leakages occur in the system.[7] Numerous regulations exist to prevent corruption. Just to maintain the Essential Commodities Act of 1955, the state has issued many control orders some of which are Tamil Nadu Kerosene (Regulation of Trade) Order 1973; Pulses, Edible Oilseeds and Edible Oil (Storage Control) Order 1977; TN Essential Commodities (Display of Stocks, Prices and Maintenance of Accounts) Order 1977; TN Scheduled Articles (Prescription of Standards) Order 1977; Tamil Nadu Sugar (Regulation and Trade) Order 1981; Tamil Nadu Paddy (Restriction of Movement) Order 1982; Tamil Nadu Scheduled Commodities (Regulation of Distribution by Card System) Order 1982. And these are sought to be implemented by the staff of civil supplies and consumer protection department and civil supplies wing of CID of the police department. But as the Latin poet Juvenal questioned: Quit custodiet ipsos custodes? (Who is to guard the guards themselves?)

The regressivity of the system becomes clear in analysing numerous elements of the subsidy system. Our system commits what Giovanni Andrea Cornia and Frances Stewart term as F-mistake (failing to reach the targeted population) and E-mistake (intervention reaches predominantly the non-targeted population).[8] Looking at the all-India as well as inter-regional picture in particular states, the distribution of subsidies seems to be substantially regressive.[9] By and large, irrigation and power subsidies are accounted for by the large farmers and they are able to increase the productivity of their farming operations. They use free power to energise pumpsets and sell groundwater to the poorer farmers who are not in a position to take advantage of these subsidies. In a number of areas such as higher education, medical facilities, and so on, wide ranging subsidies benefit everyone without discriminating in terms of their wealth or income status.

There is also the added problem of identification of the actual beneficiary in a subsidy regime. The target may be the needy and one could even observe the intended target actually receiving the benefit. But that does not necessarily mean that he was actually the beneficiary because very often the immediate recipient of the subsidy may not be the ultimate gainer. As T C A Anant has shown, the subsidies given to urban transportation benefit more the real estate owners via

higher property prices and employers through lower cost of obtaining labour than the commuters as such.[10] In this process often the relatively more affluent corner all the advantages of subsidy.

The same is the case with PDS (benefits urban areas more than rural areas) and MGR nutritious noon meals schemes. Srinivasa Narayanaswamy, president of the Federation of Consumer Organisations of Tamil Nadu estimated that out of 175 lakh tonnes of foodgrains distributed through the PDS in Tamil Nadu only 75 lakh tonnes reached the rural poor the rest went to high and middle classes in urban centres. A K Venkat Subramaniam who had occupied the post of commissioner of civil supplies in Tamil Nadu not long ago was even more blunt: "PDS is not serving the poor...PDS is tailored to meet the needs of the organised salaried sector".[11] In a study of the rice subsidy scheme in our neighbour state, Andhra Pradesh, it has been found by R Radhakrishna et al that for every rupee transferred to a poor person, 3.6 rupees reached the non-poor and 1.8 rupees were spent on administration.[12] The power sector is a case of cross-subsidisation where the manufacturing sector bears a disproportionate burden of the electricity charges whereas agricultural sector gets power free and the household sector at a less-than cost rate. Obviously this type of disincentive is bound to have a depressing impact on the industrial sector.

A legitimate criticism of the system is that it subsidises incompetence and mismanagement. Take for example the case of TANSI about which we have already mentioned. It receives considerable amount of help from the government. It would have been an even bigger drain had not the government been its sole customer. If no purchase preference or price preference is given this incompetent organisation would not have been able to compete on a commercial basis to supply items like utensils for Sri Lankan refugees and for the midday meals scheme or ballot boxes.

Not that some benefits do not accrue to the intended beneficiaries, but it tends to be minuscule compared to the resources expended. The general poverty and ignorance of the population tolerate the system knowing full well the prevailing corruption because some benefit is better than no benefits. When the poor woman gets 50 per cent of the promised Rs 5,000 for the Moovalur Ramamritam Ammaiyar wedding gift for marriageable age scheme after the party functionaries and street-level bureaucrats had their cut, she is happy to be richer by Rs 2,500. Similarly when the poor consumer gets only 75 per cent of the PDS rice, he feels happy that even at that price it is cheaper than the market price. Who cares if the PDS outlet persons pocket the difference?

A large part of the subsidy system is really counterproductive because by wasteful use of funds, it denies resources for legitimate and needed developmental purposes. The two crucial figures of the fiscal health of Tamil Nadu show how little the state has by way of funds for productive investment. Per capita deficit as per 1997-98 budget estimates is Rs 250.59 and per capita gross fiscal deficit is Rs 503.59. In short, what the Vadilal Dagli Committee stated in its *Report of the Committee on Controls and Subsidies* as early as May 1979 has come out to be absolutely true: "The possibility of their misuse or sub-optimal use and their continuance indefinitely – as a result of the pressure of vested interests – are their greatest disadvantage. As a result, subsidies could generate complacency and inefficiency, and lead to a general raising of the cost structure" (p 114). One need only to juxtapose what Arnold Harberger said in his presidential address to the American Economic Association. According to him ultimately after everything else in the growth process is accounted for, the underlying key is 'real cost reduction' in all sectors of economic activity: "It has long been my song that there are at least 1001 ways to reduce costs and that most of them are actually followed in one part or other of any modern complex economy". His conclusion is that every single policy prescription that has a bearing on real cost reduction should be pursued relentlessly.[13]

I have not considered some other consequences of the subsidy system for want of adequate data. For example, it would be interesting to analyse the impact of the subsidy system on the allocation of the individual's resources that could have major macro consequences. A study of the highly praised Sri Lankan subsidy system concludes that in "rural areas the average value of the reduction in earnings owing to the reduction in the level of work effort in response to receiving the rice ration corresponded to around one-third of the value of the subsidy".[14] Careful research may reveal similar results and suggest desirable policy directions.

Having said all this, there is the question why we persist in a subsidy system which has developed all these undesirable characteristics. Considering that Tamil Nadu administration is supposed to be competent and its political class intelligent, one would have thought that the more responsible members would have seriously considered basic issues relating to the role of the state in these areas, extent of subsidisation required, and alternative methods of delivering the goods and services. Even 'targeting' which has considerable support among the Tamil Nadu policy-makers has not been discussed sufficiently as a practical policy. Though Amartya Sen has fielded powerful arguments[15] against targeting, it may still be a useful policy framework for Tamil Nadu subsidy system. Similarly other techniques like food stamps and education vouchers could be tried at least on an experimental basis.[16]

Indeed the Tamil Nadu Planning Commission has reflected on these issues and has come out with specific policy prescriptions. In a volume entitled "Discussion Papers, Ninth Five-Year Plan, Tamil Nadu 1997-2002" prepared by the State Planning Commission, there are a number of suggestions that could be accepted by our political parties unanimously. It says for example clearly that "in each major

sector of investment" attempts should be made "to improve efficiency of resource use, conservation of resources". There is a section called 'Policy Imperatives' in this document which is a marvel of compression and says everything that needs to be said about the policy direction that the state should take to cut down real costs in our productive process and improve efficiency of the economic agents.

With unerring precision, the document points to the need for improving governance:[17] "simplify the administrative rules, regulations and procedures which will reduce delay, administration and transactions cost of doing business. At present, these costs arise in getting various licences, getting land, water supply, road and other facilities". Such an enabling environment, according to the document, is better than the "present policy of giving various fiscal and other concessions which drain the revenue of the government". It also suggests that the government policy should clearly define the role of the state in "economic matters and commercial activities". Neither state ownership nor regulation of any economic activity should be undertaken without proper justification on the basis of "market failures due to externalities, economies of scale, public goods and sunk investments...and comparative cost of public and private agencies".

Their position on infrastructural investment is faultless. Given the inadequacy of public funds, it is essential to encourage private funds to enter infrastructure sector. As investments in this sector involve large sums and lengthy gestation periods, the government should clearly "spell out long-term pricing policies" and the "pricing policies should be de-politicised so that the decisions on the extent and the timing of the price revisions can be left to independent expert regulatory bodies". The planners are not unmindful of the 'equity and social goals' and hence do not oppose subsidy *per se*. They argue that subsidy should not lead to undue inefficiency: "As far as possible, even for the subsidised sectors, the prices must have lower bounds, i e, operating cost per unit of output, or unit variable cost. There must also be an upper limit to the price of the cross-subsidising category". They also suggest that ultimately subsidies should be rationalised and eventually phased out because they lead to too many undesirable consequences such as wastage of scarce resources, excess consumption and undependable supply.

One of the earliest enquiries done about subsidies in India suggested as early as May 1979 numerous measures to guard against subsidies deteriorating into wasteful measures. It suggested among other things that a subsidy should not be valid for more than three years and if it is to be extended a review of the costs and benefits of the subsidy should be placed before the legislature. The target groups should be identified and benefits assured to them. The report made it clear that the subsidies should be overt so that costs and benefits thereof could be easily identified.[18]

There are other considerations as well because the overall impact of government subsidy policy could be different in different sectors. While one sector may suffer from inefficiency and poor delivery to get the full benefit, other sectors may suffer from a net loss in the total bargain. Looking at the all-India picture, Ashok Gulati and Anil Sharma point out that Indian agriculture is not 'net subsidised' but 'net taxed'. Their argument is that high protection to industry and an overvalued rupee has discriminated against agriculture. As "subsidies on key inputs have lost their rationale", they are "now crowding-out productive investments, damaging environment, accentuating inequity and promoting inefficient cropping pattern". What they suggest for India as a whole is applicable to Tamil Nadu as well and essentially the remedy lies in a comprehensive package of reforms involving improving the institutional structures and market organisation.[19]

IV
Explanation

The reasons why a perfectly good concept like subsidy has been turned into an unproductive incubus in its application are varied. Subsidy is a system of interconnected institutions and when the inner mechanisms decay due to the subversion of norms and rules, the system is bound to fail to deliver the original objectives. The two key institutions in this context are the political and bureaucratic structures. Both of them are behaving in a perverse manner albeit in a rational way. One can cite 'path dependency', 'asymmetric information', 'principal-agency issue', and 'multiple objectives' causing this result. The institution of subsidy functions by interaction between numerous economic agents situated both vertically and horizontally.

In the vertically organised bureaucracy controlled by the chief minister and other ministers, the objectives of the top layer may be very different from those positioned lower down the hierarchy and this has serious repercussions on their respective behaviour. The politician may genuinely want to improve the equity and efficiency of the system in order to get the approbation of the voters, but people lower down the administrative hierarchy are not likely to benefit by voter satisfaction and hence prefer immediate rewards through corrupt practices. This agency problem is confounded by unclear but conflicting multiple objectives, entertained by the leadership. Policies are arrived at as result of some or all of the following: (a) what should be done is determined on the basis of serious advice from experts; (b) The top policy-maker's perception of how the economy and society to function; (c) desire to win the affection of the people so that in dictatorships it will prevent rebellion and in democracies it will fetch them votes; and (d) unstated intention to siphon off public resources into one's own, or one's relatives, political friends, or belonging to one's own political party. Quite apart from the contradiction we can notice in the above, there are other possibilities of conflict when there could be dichotomous objectives like 'equity' and 'growth'.

'Path dependency' explains many of the unfavourable consequences of the entire subsidy system. Once something gets started, it is impossible to veer off the course. No one in the power structure dares to touch the benefits provided.[20] So schemes started to benefit particular groups can never be removed because of the pressures and vested interests that gather around that policy even though conditions have undergone changes. Take for example the shift from monopoly procurement to parallel procurement in the Cauvery delta region. Originally in order to assuage the feelings of the Cauvery delta farmers regarding the government monopoly procurement, an incentive was given. Even though the monopoly procurement policy was changed the incentive was not removed and it has continued with a new nomenclature called 'incidental charges'.

In the final analysis it is clear that a new kind of political system has emerged and that is not conducive to increasing administrative efficiency. What we have is not a democracy as defined by the philosophers of the enlightenment, and French Revolution, and liberals like John Stuart Mill. Similarly our bureaucracy is not as classically defined by Max Weber. Both of them have been debauched so thoroughly that they resemble formally without substance the originals. This is especially so when we see the Tamil Nadu political system where the politicians use

the rhetoric of liberal democracy but behave like monarchs of old. According to Tamil Nadu politicians any means – fair or foul – is acceptable to topple their opponents. If wrong economic policies will help achieve it, so be it. Our chief ministers behave like the kings and queens of old opening their treasuries for helping the poor and those whom they consider deserving. Our politicians prefer what I would like to term as the 'rishigarba' (instantaneous birth characteristic of the sages of yore) model of legislation. In other words, the political master suddenly gets an idea that he thinks will be excellent, and that is it. Something is cobbled together in the middle of the night by indifferent bureaucrats who neither know nor care to understand the details or ramifications or the consequences of this bright conception.

Every budget announces newer and newer ill-thoughtout schemes allegedly for improving the well being of the people. Invariably they are targeted towards vociferous groups. In 1997-98 budget were announced 4,000 houses free for fishermen and in 1998-99 subsidised fibreglass catamarans for 100 fishermen. Also were nationalised works of eminent scholars of the past like Kalki Krishnamurti, Thiru Vi K Kalayanasundara Mudaliar, author of film lyrics Elangovan, etc, which will go towards the benefit of their heirs. Such largesse is not limited to the annual budget. Any time is a good time to act for our modern day 'Paari Vallalgal'. On a single day, November 26, 1998, *Dinamani* reported that 28,824 dwellings for police personnel are to get 20 units of electricity per month free of cost; and the *Hindu* informed us that temples, mosques, churches and other places of worship with an annual income of less than Rs 1,000 would be given free electric power limited to one bulb. Once such policies are initiated, they can never be withdrawn. A former member of the State Planning Commission told me of a conversation he had with the chief minister. The expert suggested the withdrawal of power subsidy to the agriculturist only to get the angry retort: "Do you want me to be defeated in the next election?"

This has resulted in a kind of unhealthy Nash equilibrium in Tamil Nadu politics leading to economic inefficiency and social misrule (Figure 2). The two major parties and their supreme leaders Karunanidhi and Jayalalitha in whose hands the fate of Tamil Nadu's economy lies are caught in a prisoner's dilemma which illustrates the divergence between individual and collective rationality. Imagine two burglars are caught with gold. Unless one of them confesses they cannot be convicted and they could be imprisoned for possession of stolen gold. The choices before each of them – now kept separate – are: (a) if both admit to the crime, they will get two-years in prison; (b) if both deny the crime, they will get six-months in prison for possession of stolen gold; and (c) if only one of them confesses, he will be freed and his evidence will send the other to a six-year prison sentence. In this game of outthinking the other what should they do? Invariably both of them will confess because that is the safest. Why? If the other confesses, confession results in a two-year prison life and not confessing will get six years. If the other does not confess, keeping mum will get six months but confessing will get him freedom.

If we substitute 'inefficient and wrong economic policies for short-term political ends' for 'confessing', and 'efficient and well thought out policies for the long-term benefit of the state' for 'keeping silent', we can see the situation clearly.

What this game associated with the eminent mathematician A W Tucker concludes is that there is a sharp divergence between individual and collective rationality. In a sense, this is what the philosopher Immanuel Kant said, wrong conduct is self-contradictory. Thus if everybody were a thief, there would be nothing to burgle, and to be a thief ceases to be profitable although it is obvious that such a society cannot be civilised or prosperous. But short-term political gains, immediate financial gratification and widely prevalent apathy and ignorance indicate that Tamil Nadu has a long way to achieve equity and efficiency in its economic system in general and in the administration of subsidies in particular. Unless the Harberger[21] condition of a political consensus concerning the broad outlines of the right kind of economic policies is met, the future of Tamil Nadu's economy cannot be anything but bleak.

Appendix B

When one is far away from any problem, his analysis of it and solutions suggested are based on statistics, hearsay, attitudes, assumptions and so on that he imbibed during the period of his education. Invariably due to a desire to keep oneself uninfluenced by value judgments, economists in particular place much faith in statistics. This raises an important consideration that I have been concerned with for a long time. Whether Marx's dictum about religion being an opium of the ignorant masses is correct or not, it would appear that statistical tables are the opium of the economists. They always complain of the inferior quality of this available opium but never really worry about the quality of the stuff they consume. It always gives them the necessary 'kick' to forget the hard reality which they are supposed to explain and remedy. Can statistics capture the full reality of the grim situation? The subsidies question is a prime example how purely axiomatic and/or statistical approaches lead to a total misunderstanding of the consequences. After spending a few weeks studying the question through statistical tables and government reports from the comfort of well

appointed office space in Madras, I spent a couple of weeks wandering around my native district and these are what I heard.

"Sir. I am a very poor man and the surgeon was wonderful. When I went to thank him and wanted to give a small token sum for saving my life, he drove me away saying that if he wanted to take money from me, he would have asked me to be admitted in his private clinic. As a government doctor, he said he did his duty. Dr Avudaiappan is 24ct gold. But the days I spent in the "High Ground Hospital" were very bad. For shaving me prior to the operation, I had to give Rs 40 to the hospital barber. Another Rs 50 for the bearer who brought me from the operation theatre lest I was dropped with a thud in the bed. Every time I had to have an enema, a minimum of Rs 25 for the nurse. Sir the government thinks it is giving us free medical treatment, but it is not free for poor folk like me."

"It is the same every day sir. The 'saar' will come by the 9.30 bus. Settle down and do some gossip with the other 'saar'. He will shout at us for some time and settle down in his chair. By 12.30 he will eat and take a nap. We eat the food prepared by the acchi. At 2.00 he will wake up and have a conversation with people around and we are left to play on our own. He will take 3.45 bus and go away".

"The ration shop never opens on a regular basis. Rarely things come and we have to stand for long hours. Whenever we get anything, it is always at least 20 per cent less than what we are supposed to get. When we question we are asked to go to junction (Tirunelveli) and complain to the officers. Is it possible for us? So we accept whatever we are given. They sell all the ravai to the town hotels".

"Yes sir. It was great. It will still be a help during my daughter's wedding. I got Rs 2,500 odd net from the Moovalaur Ramamritam Ammaiyar wedding scheme. I had to spend a lot of time and money but still I was better off. Out of Rs 5,000 announced, after all my expenses, at least I got half of it."

The first three statements are crude translations of the expressive and beautiful Tamil spoken only in southern Pandya country and the fourth from a suburb of Trichy. I have summarised the much longer descriptions of the goings on. All my informants are poor and they belong to naidu, thevar, dalit and mutthuraja castes respectively. Is there anything common in all these four statements? They represent the end result of subsidy policies consciously adopted by the government supposedly to increase the well-being of the common people. What do they signify for our economy and polity?

Notes

[I am grateful to K R Palanidurai, full time member of the State Planning Commission of Tamil Nadu, for his help in the preparation of this article. He provided not only hard to get statistical data but also valuable insights into the administration of the subsidy regime in Tamil Nadu. An earlier version of this article was presented to a seminar on 'government subsidies in India' held at the Institute of Social and Economic Change, Bangalore on November 10 1998.]

1 For detailed data see Appendix A. The recovery rate figure for 1977-78 is from M Govinda Rao and Sudipto Mundle, 'An Analysis of Changes in State Government Subsidies 1977-87' in Bagchi, Amaresh et al (ed), *State Finances in India*, Vikas Publications, Delhi 1992.

2 The main data source is: *Policy Note on Food Civil Supplies and Consumer Protection* placed on the table of TN Legislative Assembly, 1998, Demand No 34.

3 All data concerning PSUs are from *Re-structuring of Public Sector Enterprises in Tamil Nadu* a report by the S V S Raghavan committee appointed by the TN government, Chennai, 1998.

4 See Madras Institute of Development Studies, *Tamil Nadu Economy Performance and Issues*, Madras, 1988, p 246.

5 See S Guhan, *Irrigation in Tamil Nadu: A Survey*, MIDS Working Paper, Madras, 1984.

6 'Input Subsidies in Indian Agriculture: A Statewise Analysis', *Economic and Political Weekly*, June 24, 1989.

7 As I was putting together this article I read in the *Hindu* (November 16, 1998) a news item which said "The 'CUT' in every contract". It clearly said "Every hand a file passes through during tendering has a percentage share which totally works up to 13 per cent of the total estimate of the work". I have not seen any denial from the government quarters. This was about construction contracts in Chennai Corporation but need we doubt that similar is the situation prevailing in every instance where the government undertakes expenditure to do something for improving the well-being of the common people?

15 See his 'The Political Economy of Targeting' in Dominique van de Walle and Kimberley Nead (eds), *Public Spending and the Poor Theory and Evidence*, Johns Hopkins University Press, Baltimore, 1995

16 Many authorities have suggested that schemes like the Employment Guarantee Scheme of the type Maharashtra government has are far superior to PDS in terms of both equity and growth. See Kirit Parekh, 'Do we Really Care for the Poor', *Economic Times*, June 1997 and 'EGS or PDS: Assessing Subsidies', *Economic Times*, July 7, 1997. M H Suryanarayana has explored the possibility of using food stamps to reduce the burden on public finances. See his 'Some Experiments with Food Stamps', *Economic and Political Weekly*, December 30, 1995.

17 Not that we need to remind our Tamil-loving politicians of this. They would be quite aware of what the grand old lady of medieval Tamil literature Avvaiyar inscribed in her *Vaakkundam* (11) "From the beginning it is the rice which germinates; nevertheless, should the husk be taken away, it will not germinate; even those who possess great power are incapable of completing the work they have undertaken, without instruments". There is no need to remind our rulers of Book II of Thiruvalluvar's *Thirukkural* which highlights the need for effective and just governance. It is interesting to note that not a single annual budget speech of the finance ministers of DMK (Karunanidhi) and AIADMK (Nedunchezhian) is without a beautiful quotation from this classic.

18 Vadilal Dagli Committee; *Report of the Committee on Controls and Subsidies*, (Government of India, Delhi, May 1979), pp 44-45. Indeed as early as 1967 the late Raj Krishna had argued that subsidies are basically short-term remedies and not to be used over a long period. See his 'Agricultural Price Policy and Economic Development' in Herman Southworth and Bruce Johnstone (eds), *Agricultural Development and Economic Growth*, Cornell University Press, Ithaca, 1967.

19 'Subsidy Syndrome in Indian Agriculture', *Economic and Political Weekly*, September 30, 1995.

20 *The Taxation Enquiry Commission* of Kerala government made a prophetic statement as early as 1969: "But once people are used to a free or subsidised service, it is only at grave political risk that the subsidy element could be withdrawn. In fact the more widespread such services are the greater is the political risk involved in the discontinuance of subsidies". Cited in p 22 of Jose Sebastian, 'Issues Relating to Subsidies in Kerala: A Politico-Socio-Economic Perspective', paper read at the Institute of Social and Economic Change, Bangalore on November 10 1998

Dalits and the BSP in Uttar Pradesh

Issues and Challenges

Pradeep Kumar

After establishing its monopoly over dalit votes, especially the numerically strong jatavs and pasis, the BSP is attempting to turn the electoral arithmetic in Uttar Pradesh in its favour by wooing the upper castes who are no longer in direct conflict with the dalits in view of the structural changes in rural India. The BSP undoubtedly has instilled self-respect among the UP dalits through its strategy of single-mindedly pursuing electoral power. Yet, its neglect till now of well-thought out programmatic content, besides its loose hold over other dalit castes and MBCs, can prove a hindrance to evolving a more inclusivist agenda for the future.

THE word dalit was never a familiar word for the lower castes in Uttar Pradesh before the BSP popularised it in last one and a half decades or so. A better understood word was 'harijan' or simply 'scheduled castes' in view of their categorisation by the Indian Constitution for purposes of protective discrimination, etc. The shift from harijan to dalit was not without purpose. A fierce debate took place between the detractors of Gandhi and his supporters about the alleged motives of the former behind the popularisation of the word for the lowest of the low castes of the Hindu society. The term harijan was indeed used by Narsinh Mehta, a poet saint and reformer of Gujarat (17th century) which was later popularised by Gandhi in the 20th century. Incidentally, the term was also used for the children of the devdasis, the temple prostitutes, who were also technically the children of the gods (harijans), but were looked down upon in the society for their low socio-economic status. The debate continued in Indian media and academic circles for a long time in the 1990s when Kanshi Ram and Mayawati took exception to the use of the term for those whom now the BSP called 'dalits'.

The BSP duo went a step further and imputed motives to Gandhi, using almost derisive, if not abusive language, for him which made the Gandhians retort in a big way. Gandhi was pitted against B R Ambedkar, E V R Naicker (Periyar) and Shahu Maharaj (of Kolhapur) by the BSP. Mayawati during her chief ministership celebrated Periyar and Ambedkar melas (festivities) in a big way in UP, and when she was carving out, districts after districts in the state, she named quite a few after these 'low caste' leaders – namely, Gautam Buddha, Ambedkar, Shahu Maharaj, Sant Ravidas, Mahamaya (Buddha's mother), Jyotiba Phuley, etc – none of whom (except Ravidas) actually had much to do with UP. Interestingly, many of these names (except Ravidas and Ambedkar) were perhaps not even known to many in the state.

While the academics indulged in an unending debate about Gandhi's possible motives in using the term harijan, the BSP raised yet another issue of Gandhi being addressed as the 'Father of the Nation'. All this debate which at one time became quite acrimonious was carried out not without purpose. The BSP was actually interested in asserting that the low castes, now termed dalits in UP, were in no mood to accept the patronage of the caste Hindus. Any reference therefore to Gandhi's goodwill/sympathetic gestures towards the harijans only infuriated the dalit leaders. Even the term scheduled castes, popularised by the constitutional provisions for reservations, which had become a commonly understood nomenclature for these castes, was dropped in preference for dalits. This was natural for the kind of politics that the BSP was looking forward to. The terms like 'bahujan samaj', harijan, scheduled castes, etc, denoted only social and administrative identities of these lower castes, and smacked of either patronage or affirmative action on the part of the state. In short, these were too 'soft' to be used in a political battle for assertion. The academics only fell in the trap and endlessly debated the history and genesis of these words, while the BSP succeeded in galvanising a very large section of the dalits to its political programme which precisely meant nothing more than voting for the BSP candidates in the vidhan sabha and the Lok Sabha elections.

Unlike the earlier incarnations of dalit politics, the BSP hardly talks about any serious social or educational blueprint. Its firm belief seems to be to take control from above, by jumping into the electoral fray which alone is a key to power in an electoral democracy. This accounts for Kanshi Ram's sole concentration on transfers of the IAS officers in UP during Mayawati's stint as chief minister, and this also partly explains the absence of any serious academic or intellectual discourse on dalit politics or Hindu order *a la* Phuley, Ambedkar or Periyar

Rise of the BSP

The BSP began as an outfit of the government employees under the banner BAMCEF, i e, Backward and Minority Communities Employees' Federation in 1978 as the brainchild of Kanshi Ram. It gradually developed into a political party when its activists' wing, Dalit Shoshit Samaj Sangharsha Samiti (DS-4), established in 1982, finally gave way to the BSP. It is true that this party originally claimed to mobilise the minorities (read the Muslims) in addition to all the non-'dwija' castes (the term 'bahujan' precisely implied the numerical majority of the non-dwija castes), but at no point of its growth could it ever seriously make a dent in the backward caste votes, the OBCs. Even the Muslim support was never statistically proved, and in fact a section of the Muslims actually got annoyed by its leader Mayawati, at one point of time, accusing her of accusing them of disloyalty.

However it had a breakthrough in the three vidhan sabha by-elections in UP in 1987 when the BSP got 26.3 per cent of the valid votes. The party was successful in drastically reducing the winning margins of the Lok Dal (from 21.93 to 0.70 per cent compared to the previous elections), and the BJP (from 9.86 to 0.20 per cent). It was in Hardwar Lok Sabha by-election that the Janata Party stalwart Ram Bilas Paswan lost his security deposit. Even Jagjivan Ram's daughter, Meira Kumar, could win the Bijnore Lok Sabha seat on Congress(I) ticket by a thin margin of only 5,000 votes, even as the BSP

candidates in these constituencies scored 26 per cent and 18 per cent votes respectively.

In the 1989 Lok Sabha elections, the party won three Lok Sabha seats with 2.4 per cent all-India votes from the 235 Lok Sabha constituencies where it fielded its candidates. It therefore emerged as the sixth all-India party in terms of votes polled, next to the CPI with 2.67 per cent. Unlike the other Ambedkarite groups which were eventually marginalised in the national politics, the BSP continued its electoral gains [Kumar 1990] and successfully got recognised as a national party by the Election Commission of India in 1997, ironically on the eve of the 12th Lok Sabha elections when its supremo Kanshi Ram lost his seat from Saharanpur in UP, and its tally in the Lok Sabha was reduced from six to merely five. A glance at party's performance from 1989 to 1998 elections in UP shows the grounds that it has broken in last few years (Table 1).

In the UP vidhan sabha, the party has increased its tally considerably from 13 in 1989 to 66 in 1993 which has for the time being stabilised around this figure as the party retained almost the same figure (67) in 1996 assembly elections in the state. Its vote share also remained almost static between 1996 Lok Sabha elections (20.6 per cent) and 1998 elections (20.7 per cent)

Shift in the Support Base

Important to note, however, is the fact that the BSP has almost monopolised the dalit votes in general, and the chamar (jatav) votes in particular, in UP. An analysis of the 1996 (Lok Sabha) elections in the state shows this very clearly. The BSP secured less than 3 per cent of upper caste votes, 4.3 per cent of yadav votes, between 15 and 20 per cent of the peasant, artisan and other backward castes votes, nearly 25 per cent of koeri votes but it got 45.7 per cent of pasi votes, and a very high 73.8 per cent of the chamar votes. Its tally among the dalit votes in general was 60.6 per cent, which was fairly high. Thus, except the koeris, no other backward castes had any particular closeness to the BSP. The latter's monopoly of chamar votes is matched by the SP-JD's control over yadav and Muslim votes which was 72.7 and about 71-73 per cent respectively, or the BJP's hold over the upper castes like brahmin (64.9 per cent), kshatriya (66.7 per cent), vaishya (72.1 per cent), other high castes (66.7 per cent) (Table 2).

It will be interesting to take a comparative look at the performance of the BSP and some other political parties among the various caste-class groups in the last two Lok Sabha elections in UP. As is revealed from Tables 3 and 4, the hold of the BSP on the SC votes is on decline; it came down from 59.2 per cent in 1996 to 50.5 per cent in 1998. The BJP, on the other hand, increased its share of the dalit votes from 10 per cent to 18.4 per cent in the same period. As a corollary of this, dalits constituted only 64.5 per cent of the total BSP votes in 1998 as against the 1996 elections when almost 80 per cent of the BSP votes came from this caste group alone. It was the BJP which in fact increased its share of the dalit votes from 6.5 per cent in 1996 to 10 per cent in 1998. While there has been negligible change in the OBC support of the BSP, it has ironically gained ground among the upper castes. While only 3.6 per cent of the BSP's voters in 1996 came from these castes, this percentage went up to 10.2 in 1998 even though it remained quite insignificant (4.1 per cent) when calculated as a part of the total upper caste votes.

It would be worthwhile to examine if this shift from dalit up upper caste support base was also reflected in the class composition of its voters. Tables 5 and 6 indicate that while 44.7 per cent of the BSP's total votes in 1996 came from the very poor sections of the society, this percentage drastically declined to 25.2 in 1998. As a natural consequence of this, the percentage support from among the middle and the upper classes increased, which was more revealing in case of the support from the upper classes who constituted 7.1 per cent of the total BSP votes in 1998 as against only 1.2 per cent in 1996. Thus, while in 1996 the BSP cornered the largest percentage (35.7) of the very poor voters, in 1998 it was replaced by the SP and the BJP in this respect which polled 28.9 and 25.9 per cent of the very poor category of votes, leaving the BSP the poor third with only 19.4 per cent votes in this category. Similarly, in the category of poor voters, the BSP's score (19.4 per cent) was lower than that of the BJP (33.5 per cent) and the SP (20.8 per cent) in 1998, even as it had scored the maximum in this category in 1996 along with the BJP, each of which polled as many as 24.3 per cent of the poor votes. On the other hand, the BSP's share in the upper class votes improved from 1.6 per cent in 1996 to 8.5 per cent in 1998.

The comparative analysis of the two Lok Sabha elections may relate to too short a period to look for some tangible and sustainable trends in the shift in the party support base. However, it may be partly ascribed to the BSP's increasing

Table 1: Performance of BSP in UP

Years	1989		1991		1993	1996		1998

realisation that mere reliance on the dalit votes (only a section of whom has been successfully mobilised by the party) would not turn the electoral arithmetic in its favour. This has made it broaden its support base by making attempts to woo the upper castes, many of whom are no longer in direct conflict with the dalits in view of the structural changes in the rural India where the 'neo-exploiters' of the dalits happen to be the landowning OBCs; the little progress made by the party in the OBC vote bank may be precisely for this very reason. The decline in dalit support for the BSP may also be partly on account of the alienation of some sections of the dalits from the BSP in view of its increasing identification (discussed earlier) with only a few sub-castes of the dalits. Consequently, while the chamars and the pasis tend to monopolise the BSP's electoral base, the other sub-castes such as the balmikis, the shilpkars, and the artisan castes tend to vote for the alternative formations like the BJP, which has also succeeded in mobilising a sizeable section of the dalit voters.

The BSP's strategy of broadening its base by making inroads into the upper caste votes is not new. Even in the vidhan sabha elections held in September-October 1996, it had entered into a pre-election alliance with the INC with the proclaimed objective of getting the support of the upper castes, who in the BSP supremo's political scheme were to vote for the INC candidates. The then Congress president, Sitaram Kesari, was specifically 'advised' by Kanshi Ram to give tickets to upper caste candidates. Whether the shift evident in the 1998 Lok Sabha elections actually reflected the outcome of this strategy, or was only an aberration on account of technical faults in the survey data, will be known only after it is substantiated by elections to be held in near future.

Mobilisation from Above

What has happened over the years is a considerable rise in the political consciousness of the dalits in some north Indian states. This has been translated into the support for the BSP, which unlike the earlier Amedkarite groups is a militant party, not in the ideological of programmatic sense but in the political sense of the term. While the earlier dalit outfits like the Dalit Panthers spent time and energy on issues like reinterpretation of the religious texts, resulting in the publication of distinct dalit literature from below, the BSP's only strategy has been to attack its opponents in as militantly and aggressively transparent a language as possible.

It has spared no effort in being absolutely crude and unconventional in its electioneering, and has restrained from 'wasting' energy on efforts aimed at revolutionising the dalit social consciousness. The project of Ambedkar villages in UP which began in Mulayam Singh Yadav's chief ministership and was carried forward during Mayawati's tenure, is no doubt aimed at socio-economic upliftment of the dalit population. But much of this amounts essentially to "social engineering from above" [Pai 1997]. Kanshi Ram actually targeted the relatively educated sections among the dalits, particularly from the bureaucracy, from where began his original outfit BAMCEF.

The relatively fair representation of the dalits in bureaucracy, thanks to the reservation policy, made him concentrate on these bureaucrats during his party's rule in Lucknow when a major task of his party's chief minister Mayawati was to order a reshuffle in UP bureaucracy to ensure the 'right' kind of bureaucrats in the sensitive and important positions. Thus, the dalit bureaucrats became 'agents' of social change. Holding of Periyar mela in Lucknow, installation of a very large number of statues of Ambedkar (15,000 according to one estimate), renaming of almost every new district after a supposedly dalit hero, extension and expansion of the Ambedkar village scheme, naming of roads, libraries and parks after the 'dalit heroes' created a political fervour and sensitised the dalit masses on these issues.

Though all this was done purely on the political plane, yet this 'mobilisation from above' had its desired consequences. In the absence of any seriously thought out ideological content, this strategy became a good substitute for a dalit ideology in the state, and paid rich political dividends at the time of elections. This strategy of the party has "generated in parts of UP, a socio-cultural process of 'Ambedkarisation', i e, a tremendous growth in the consciousness among dalits about the life and ideas of Ambedkar" [Pai 1997]. It was reminiscent of M G Ramachandran's use of term 'Annaism' (ref C N Annadurai) to describe his AIADMK's party-ideology, without ever defining what it actually meant. Indira Gandhi's 'garibi hatao' slogan also aimed at 'radicalism' sans any concrete action programme. This strategy of the BSP has created "enclaves of development benefiting the rising entrepreneurial groups among the forward rather than the really poor dalits and BCs, creating greater social fragmentation, jealousy, caste tensions and alienation" [Pai 1997].

Besides this, the chamars have been the major beneficiaries of the party's strategy of relying on bureaucrats for implementation of party programme from above. This is natural in view of the jatavs (chamars) being the most powerful group in the dalit bureaucracy of the state where, thanks to job quotas and self-efforts, these have become neo-brahmins among the dalits. The kureel/jatavs holding class I jobs compare favourably with the brahmin, kayastha and vaishya communities in UP [Pai 1997].

Another major drawback of this strategy has been that it relies very heavily on the state machinery, which may be alright but for the fact that it is rendered absolutely useless when the party is out of power. Much of the gains made during the party's reign could be easily frittered away by the rival political parties even if it is politically not expedient for any ruling party to reverse the process. It is evident in the Ambedkar villages-scheme which was initiated in 1991 during Mulayam Singh's chief ministership, but taken up by all the subsequent political formations in the state capital. It is however doubtful if a non-dalit mainstream party would show the same zeal even as it may formally accept the scheme.

Finally, the party strategy of enclave development is not aimed at 'revolutionising' the dalits. As is often argued, any attempt at broadbasing a community ironically retards the process of the making of a revolutionary consciousness [Nadkarni 1997]. But then a revolution has never been on the party's agenda, and its greatest emphasis although has been on the quick dividends from the assertion of a dalit political identity, entirely epitomised in the BSP seats in the legislatures.

BSP's Technological Rationality

Whatever the limitations of the BSP strategy, it has successfully begun a political movement among the dalits in UP who were looking forward to a political party in view of the vacuum created by the almost total collapse of the Congress Party in terms of its possibility of forming the government in UP. It may be mentioned here that while the Congress decline is far from complete at the national level where it continues to be the second largest party after the BJP, it has almost disappeared from UP. The party secured only five seats with barely 8 per cent votes in 1996 Lok Sabha elections, and has drawn a blank in the 1998 Lok Sabha elections. In the vidhan sabha poll held in September-October 1996, which the Congress contested in alliance with the BSP, the former's seat share went down to 33 which in a way forced the somewhat politically impatient BSP to drop its political ally in favour of the BJP from whom it 'grabbed' chief ministership for its leader Mayawati for the first half of the year.

It is important to note that the BSP's success lies not in its electoral victories alone, but more so in its capacity to bargain. Kanshi Ram's strategy of militant dalit assertion forced a party like the Congress to give almost 300 out of 425 vidhan sabha seats to its 'junior' partner, the BSP (UP vidhan sabha poll 1996), so much so that in a press conference, widely televised, the party supremo of the BSP asserted in the presence of the Congress leaders that the BSP had deliberately chosen a 'weak' partner like the Congress in view of the 'dependence' of such a partner on BSP.

In a way the BSP's focus on acquiring political power, more particularly the chief ministership, by all means, actually aimed not so much at introducing social engineering from above (as some analysts would have us believe) as inspiring the dalits by putting a dalit at the helm of affairs. It is important to remember, the real problem in the rural areas is not so much of the unavailability of resources as it is about the 'inaccessibility'. The issues like 'begar' (forced labour) and high incidence of illiteracy among the dalits and some of MBCs can be taken care of, not merely by greater allocation of funds for these purposes. These are essentially questions which are linked to the greater issue of political empowerment.[1]

Similarly, the public humiliation meted out to the upper castes in general, and some senior bureaucrats in particular, was not a result of the BSP leader's short temperament. It meant the "dalit power to tame upper caste establishment". This may sound very short-lived to a rationalist, and the party leaders may be accused of taking short cut routes, but this does help to inspire its voters.

Kanshi Ram's assertions in public that his party is not for 'stability' but for 'instability', his candid acceptance that his party was somewhat opportunistic and wanted its own chief minister by entering into any alliance which made that possible in UP, all point to this strategy of political assertion. To argue that the party's aim is to destabilise the system, when everyone else is talking about stability, sounds quite revolutionary, even though this is not followed by any programme for the dalits.

The BSP's strategy has undergone some change ever since it flirted with the mainstream parties like the BJP and the Congress. It shared power with the former in 1995 and 1997, and had a pre-election alliance with the latter in 1996, which later broke down when the Congress failed to muster enough support for the BSP chief minister in UP. Besides these alliances, the party had earlier entered successfully into an alliance with the SP. Most of these alliances, even though strange on a cur-

sory look, had an element of 'market democracy'. Kanshi Ram had eyed the non-dalit votes, like the backward castes and the upper castes, to compensate for the party's numerical handicap. He had hoped that Mulayam Singh Yadav's SP would fetch powerful backward caste votes which were needed despite dalit's antipathy to most of these castes. Later, he toyed with an idea of getting upper caste support by joining the Congress alliance. The Congress had by then (1996) been reduced to small pockets of the upper castes in UP, and Kanshi Ram even reportedly advised the Congress chief, Sitaram Kesari, to field some upper caste leaders on Congress ticket so as to compensate for the BSP's lack of support among these castes. Thus, 'technological rationality' rather than any ideology was the party's clear choice. This did not always pay dividends, is quite another matter.

The BSP did not resort to alliance game without reason. The party has of late realised that it was not capable of garnering sufficient support from the backward castes which have no love lost for the dalits. In fact, the backward-dalit antagonism in rural India, discussed earlier in this paper, does not allow the party to broaden its base. The thevar-pallar clashes in Tamil Nadu, the kurmi-chamar antagonism in UP, are very well known. The class interests of the backwards who happen to be neo-brahmins after land reforms and green revolution, tend to clash with the dalits many of whom continue to be landless in rural India. In fact when the party came close to the 'manuvadi BJP', it was hoped that the alliance would be more workable than the SP-BSP alliance, as the antagonism between the upper castes and the dalits is no longer as sharp as it is between the backwards and the dalits, in view of the changed landownership patterns in the last two or three decades. It did not work well, is another story but still the BSP-SP rivalry continues to be somewhat more serious than BSP-BJP rivalry.

The powerful backward caste of the kurmis was earlier mobilised by the BSP but soon it was realised by the two that the economically and numerically powerful kurmis would not be comfortable in an essentially dalit dominated formation. The splits in the BSP in 1995, and walk out of Ram Lakhan Verma (an aspirant for chief minister's post) symbolised the kurmi revolt in the BSP (*Pioneer*, November 6, 1995, Delhi edition). The Kurmi Mahasabha was sufficiently active during these days and the newly formed, even though eventually marginalised, Apna Dal, marked the alienation of the kurmis from the dalit leadership of the BSP. It was this challenge which perhaps forced the BSP to look for greater support from among the potential friends of the party. Consequently, a large number of rallies were organised to mobilise the nishads, the pasis (traditionally engaged in swine husbandry, numerically second powerful dalit subcaste after the chamars), the dhobis, the khatris, the kewats, the kushwahas (the traditional vegetable growing caste, variously known as the sainis, the mauryas, the malis, the shakyas, etc). This was a must to dilute the party's image essentially being that of a chamar political outfit (*Pioneer*, April 9, 1994). The efforts of the party to revive and reconstruct the legacy of Maharaj Lakhan Pasi, a ruler of Lucknow around 1100 AD and who supposedly gave his name to Lucknow, were aimed at catering to the second dominant group among the dalits. The function organised at Maharaj Bijli Pasi's fort (Lucknow) was to boost up the caste morale by giving the community a sense of pride in its history.

Conclusion

These strategies of the dalit elite have paid rich dividends to the party in view of the emergence of a relatively economically well off and politically autonomous elite among the dalits. The various empowerment schemes and reformative measures taken up by the state over the years for amelioration of the poor, have actually brought the dalit castes out of the electoral passivity which characterised their behaviour till the 1950s and the 1960s of this century. Lack of development and education among these castes had earlier kept them as vote banks of various mainstream parties where they could only be used as a junior partner of a broad Muslim-brahmin-SC alliance. Even the backward castes were initially part of this larger group. But the various constituents of this conglomeration particularly after the dismemberment of the Congress dominant system got disengaged and the dalit elite emerged as an independent force in UP politics in the eighties.

The greatest challenge before the BSP remains to unite, if not 'homogenise' the dalits. As is evident from dalit-dalit clashes in several parts of the contrary, 'dalit' is as much an artificially constructed category as 'backward'. In UP alone there are some 66 castes[2] listed as dalits, and the chamars, the pasis, the balmikis, are only some of the relatively numerous ones. The distribution of benefits of different governmental reform programmes, has often unevenly benefited these sub-castes among the dalits. Often in league with some powerful backward castes which were influential in guiding the government officials in identifying the 'poor' in the villages, some sub-castes benefited more than others.

The BSP will also have to work hard in the meanwhile for forging a political unity (even if it solely relies on electoral politics) of all the groups that have somehow remained either immobilised, or are still looking for a political party which could articulate 'primarily' their interests. These include the hitherto neglected dalit castes such as balmikis, doms, khatiks, kols, kanjars, nats, kalabazs and badhiks, etc, besides, some of the MBCs and the scheduled tribes, many of whom are extremely backward in all respects, also are in need of attention. This combination, if pursued vigorously, will inflate the numerical support base of the BSP in addition to making its agenda look more rational and inclusivist.

Notes

1 In a very perceptive study of the musahars (an extremely poor sub-caste of dalits) in a Ghazipur village of east Uttar Pradesh, P Sainath, a writer-journalist, observed that the Kanshi Ram-Mayawati phenomenor has helped improve the situation with regard to forced labour (begar). The awakening among these musahars has made it possible for some of them to stand up to those who have been forcing them to do 'free labour'. See P Sainath, *The Hindu*, April 5, 1998.

2 The scheduled castes in UP, among others include such sub-castes as agaria, badhik, bahelia, balmiki, dhanuk, dhobi, dom, dusadh, gwal, kalabaz, kanjar, banmanush, bansphor, bawaria, shilpkar, jatav, sansiya, nat musahar, kol, khatik, etc.

1999-2000 Budget and the Industrial Sector

J C Sandesara

The examination of the budget proposals for 1999-2000 for their impact, short and long term, on industrial growth. Also discussed are the larger questions of GDP growth, fiscal deficit and whether the budget comprises a move towards pushing reforms.

I
Introduction

HOW would the various proposals of the union budget for 1999-2000 affect industrial growth during that year? This article is addressed largely to this question. As the principal purpose of these proposals is to augment industrial growth, we begin in Section II with the experience of the recent past in this area. Owing to space constraints the article focuses on the main proposals. The wide variety of these proposals suggests that dividing them into the following four groups would be meaningful:

(1) Proposals which relate directly to the industrial sector as a whole;
(2) Those which relate directly to specific sectors of industry;
(3) Those which relate indirectly to the industrial sector as a whole or to specific sub-sectors; and
(4) Those which seek to initiate reviews and discussions for possible follow-up action.

The first three groups of proposals would have impact on industrial production in 1999-2000 and in the later years as well. As for the fourth group, it is unlikely to have any impact in 1999-2000 but may have some relevance for later years. Sections III to VI deal with these proposals.

As a secondary purpose, this article comments on the widely discussed numbers on GDP growth and fiscal deficit emerging from the budget, and on the question of whether this is a reform-pushing budget, Section VII is devoted to these issues. The last section is composed of a summary.

II
Industrial Growth

Table 1 gives the statistics of GDP growth (aggregate and by three sectors) for the five years ended 1998-1999. GDP growth for the first three years was a little under 8 per cent. It slowed down to 5 per cent in 1997-98 but recovered to 5.8 per cent in 1998-99.

Growth in agriculture and allied activities fluctuated widely over these years, ranging from minus 1 per cent in 1997-98 to over 5 per cent in 1994-95 and 1998-99. The rates of growth of industry and services were at their lowest in 1998-99: 4.7 per cent and 6.7 per cent, respectively.

One must read meaning in these statistics with a lot of care. First, the rise in aggregate GDP growth in 1998-99 from the 1997-98 level is wholly due to very high growth of agriculture and allied activities in the former year. Second, the growth data for 1994-95 and 1995-96 are actual, but those for 1996-97, 1997-98 and 1998-99 are respectively provisional, quick and advance estimates and therefore subject eventually to change – which may result in different numbers. Thrid, growth numbers are based on 1993-94 prices, whereas the earlier base year for the purpose of prices was 1980-81. This new series estimates GDP levels about 9 per cent higher on an average than the old series. The higher estimates have arisen principally because the previous series left some existing economic activities out of account and estimated the working population at a lower level. This means that part of the increase in GDP is purely statistical – accounted for by better recording.

Let us now look at the industrial production growth statistics in detail focusing on 1997-98 and 1998-99. Since the 1998-99 statistics are available only for nine months (April-December), the 1997-98 statistics are also presented likewise. The growth rates are based on the index of industrial production (IIP) – 1993-94=100. Table 2 deals with the three principal sectors of the IIP, Table 3 with use-based classification of industries and Table 4 with 17 broad industry groups. These tables are from *Economic Survey, 1998-99* (pp 96, 100 and 100 in that order).

It will be seen from Table 2 that industrial growth (general) slowed down to 3.5 per cent in 1998-99 from 6.7 per cent in 1997-98. Electricity growth was higher in 1998-99 than in 1997-98 (6.6 and 6.5 per cent) but the growth rates for mining/quarrying and manufacturing were lower (–1.1 per cent and 5.5 per cent in the former and 3.7 per cent and 6 9 per cent in the latter).

Coming to the use-based classification of industries, growth in capital goods was higher in 1998-99 than in 1997-98 (9.8 and 6.7 per cent), but lower in the other three sectors by a wide margin (basic goods 1.4 and 6.8 per cent; intermediate goods 4.7 and 9 per cent; and consumer goods 2.8 and 4.6 per cent).

Table 3 on the 17 manufacturing groups shows that growth was higher in 1998-9 than in 1997-98 in seven groups. In th case of the food products and other manu facturing industries groups decline ha turned into positive growth. Each of thes seven groups recorded a high growth rat

On the other hand 10 groups recorde lower growth rates in 1998-99 than i 1997-98. In the wood and wood product group the negative growth of 1997-98 wa aggravated in 1998-99. In four group (cotton textiles, textile products, basi metals, and machinery and equipmen there was a shift from positive growth i 1997-98 to negative growth in 1998-9 In almost every one of the 10 groups th deterioration was sharp.

The weight of these 17 groups in th IIP is 79.4. The seven groups which ex perienced higher growth accounted for total weight of 27.9 and the 10 group which had lower growth for one of 51. (35 per cent and 65 per cent, respectively)

To sum up: these statistics highlight th general slowdown of industrial growth The signals are loud and clear whethe one uses GDP data or any of three sets o IIP data.

III
Taxation

The first group of proposals relates t taxation, direct and indirect (excise an customs duties).

DIRECT TAXES

The two main proposals on direct taxe relate to the imposition of a surcharge c 10 per cent on the tax on individual/Hind undivided family incomes of Rs 60,00 or more and on corporate income tax Thus, the 20 per cent and 30 per cent ta brackets on the former become 22 and 3 per cent, the 35 per cent corporate ta bracket becomes 38.5 per cent. Togethe with other provisions on incentives/con cessions this is expected to yield a ne revenue of Rs 3,100 crore.

This is the first time since the economi reforms were initiated in 1991 that ta

non-durable, and for agricultural inputs produced by the industrial sector: fertilisers, insecticides, pesticides, cement, tractors, power, etc.

Growth of construction activity such as that for residential, commercial and industrial purposes increases the demand for steel, cement, furniture and fixtures, wood and metal products, etc. Growth of infrastructure increases the supply of power, transport, communications, etc, to industry, which in turn transmits growth impulses to the industries which cater to the input needs of infrastructure. Improvements in the capital market and related areas enhance the availability of finance at competitive rates to industry, and make for a more efficient allocation of resources.

Agriculture

The outlay on agriculture has been raised by a substantial 36 per cent. Irrigation charges are proposed to be rationalised, storage and marketing facilities to be improved. Food processing and related industries have been placed in the priority list of industries. Regional rural banks will be strengthened. The corpus of the rural infrastructure development fund is being raised from Rs 3,000 crore to Rs 3,500 crore.

Housing

A number of proposals seek to increase the flow of credit to the housing sector. These relate to changes in the laws for foreclosure and transfer of property, the development of primary and secondary markets for housing, the strengthening of housing finance companies, the easing of bank rules for housing finance, etc. The budget has also proposed a number of incentives/concessions for individual borrowers, housing companies and businesses/industrialists buying/building houses. Special attention is being paid to the provision of shelter to the shelterless in rural areas.

Infrastructure

The budget has proposed a number of incentives/concessions for promoting infrastructure development. The transmission and distribution of power will be eligible for fiscal incentives. The Income Tax Act will be amended to provide for a uniform maximum period of 15 years within which units can avail of the tax concessions. To accelerate industrial growth in the north-eastern region it is proposed to introduce a ten-year tax holiday for all industries located in growth centres, for specified industries and for industrial infrastructure development corporations.

Capital Market and Related Areas

It is here that the budget is most eloquent. It is proposed to go in for strategic disinvestment in public sector undertakings. The budget for revenue from this source in 1999-2000 is Rs 10,000 crore. It is also proposed to make the voluntary retirement schemes of these undertakings more appealing to the workers. It is proposed to amend the Income Tax Act to facilitate mergers/de-mergers. Income in the hands of investors in the Unit Trust of India (UTI) and other mutual funds is exempted from tax. The US-64 scheme of UTI and other mutual-fund schemes with more than 50 per cent investment in equity are exempt from income tax. The long-term capital gains tax for resident Indians is reduced from 20 to 10 per cent. The Gold Deposit Scheme is to be introduced. Income from interest under this scheme is exempt from income tax. Nor is wealth tax or capital gains tax applicable.

A few days after the budget, the Reserve Bank of India reduced the bank rate by a percentage point to 8 per cent, the repo rate to 6 per cent from 8 per cent and the cash reserve ratio (CRR) to 10.5 per cent from 11 per cent. Reductions in prime lending rates and other lending rates in varying measures by banks followed this move.

The stock market upsurge that followed the budget is attributable largely to the budget proposals relating to customs duties, the sunrise industries and the activities reviewed in this section, more particularly in the capital market area. The upsurge was aided by the interest reductions announced by the RBI. But is this upsurge durable? Is it warranted by the likely growth of industry and overall gross domestic product (GDP) in 1999-2000? Our discussions in Sections III to VII suggest only modest industrial growth of 6.7 per cent and a small overall growth of 6 per cent in 1999-2000, compared to growth rates of 4.7 per cent and 5.8 per cent respectively, in 1998-99. The upsurge is thus bound to abate eventually.

Two awkward questions pertaining to the budget proposals dealt with in this section are: if growth does not pick up, would the government be able to raise enough revenue, through taxation in particular to spend on these programmes as budgeted for? For that matter, would the necessary spending be feasible even if growth does pick up? Consider, for example, the recent experience *vis-a-vis* the outlays on agriculture and allied activities. Even though the 1999-2000 Central Plan for agriculture and allied activities has a budget of Rs 3,736 crore, representing a 36 per cent increase over the 1998-99 revised outlay of Rs 2,777 crore, it is less than the budgeted outlay of Rs 3,864 crore for that year; and although the budget outlays on rural development and irrigation and flood control for 1999-2000 are slightly larger than the revised outlays for 1998-99, they are less than the budget outlays for that year.

Next, the problems in housing are many and varied. The existing Urban Land Ceiling Act and non-implementation or tardy implementation of the Rent Control Act, despite clearance by the Supreme

Table 4: Growth Rates of Industrial Production by Broad Group of Manufacturing, 1997-98 – 1998-99 (April-December)

(Per cent)

Two-digit Groups (Weight)	1997-98	1998-99
A Where growth was higher in 1998-99 than in 1997-98		
1 Food products (9.1)	–2.0	2.8
2 Paper and paper products, and printing, publishing and allied industries	5.4	16.0
3 Leather and leather products and fur products (1.1)	2.8	5.0
4 Rubber, plastic, petroleum and coal products (5.7)	4.0	10.6
5 Metal products and parts, except machinery and equipment (2.8)	3.8	22.9
6 Transport equipment and parts (4.0)	3.8	20.9
7 Other manufacturing industries (2.6)	–2.3	10.1
B Where growth was lower in 1998-99 than in 1997-98		
1 Beverages, tobacco and related products (2.4)	17.3	13.8
2 Cotton textiles (5.5)	5.4	–9.9
3 Wool, silk and man-made fibres, textiles (2.3)	21.6	1.6
4 Manufacture of jute and other veg fibre, textile excluding cotton (0.6)	21.3	–5.4
5 Textile products (including wearing apparel) 2.5	8.6	–3.1
6 Wood, wood products, furniture and fixture (2.7)	–3.1	–3.3
7 Basic chemicals and chemical products (excluding products of petroleum (14.0)	14.5	5.5
8 Non-metallic mineral products (4.4)	15.2	1.4
9 Basic metals and alloys industries (7.5)	3.4	–3.0
10 Machinery and equipment other than transport equipment (9.6)	6.9	–3.3

For explanations and source, see text in Section II.

Court, stand as major impediments to increase of the supply. Partly because of this and partly because of the economic slowdown of the recent past, a fairly large number of houses of varying sizes fit for occupation are known to have remained unoccupied for long, especially in big cities. This points to considerable excess capacity. A factor of larger import relates to growth of income and employment: if it is not fast enough further construction activity would be impeded by relatively low demand for residential, commercial, and industrial accommodation.

Third, industry's demand for funds (short-term as well as long-term) has of late been constrained by slack in industry. So banks have generally been flush with funds. Part of the disbursements by banks and financial institutions is known to have been effected to facilitate repayment of old dues. And although industrialists have been lobbying for low interest rates, it is a moot point whether such slight changes as are made off and on can make a material difference to the pace of industrial growth. If industrial growth does not pick up substantially, the increased liquidity would increase the interest costs of banks, leading eventually to lower deposit rates. This may affect the flow of savings adversely. Attention may be drawn to recent data in this context. The savings statistics for 1998-99 and 1999-2000 are not available. Those for 1997-98 shows a decline in relation to the previous two years. Gross domestic savings as a percentage of GDP at current market prices were 24 per cent and 24.4 per cent in 1995-96 and 1996-97, respectively. They declined to 23.1 per cent in 1997-98. The decline embraced the private sector as well as the public sector.

These considerations moderate the hope that the activities discussed in this section would make a major contribution to overall industrial growth. But surely, one can hope for a moderate contribution?

The contribution of industry (mining and quarrying, manufacturing, electricity, gas and water supply, and construction) to GDP went up by 4.7 per cent in 1998-99. The discussion in this section prompts the guess that the proposals discussed with add a little more than 1 percentage point and the discussion of the proposals of the previous two sections the guess that they will add a little less than 1 percentage point in 1999-2000 to the growth rate of 4.7 per cent of the previous year. On the basis of these guesses, GDP growth of industry would be around 6.7 per cent, say, 7 per cent in 1999-2000. We have therefore assumed 7 per cent industrial growth in our discussion on overall GDP growth in Section VII.

VI
Spadework

We now take up the proposals which seek to review and examine the existing procedures and policies with a view to making them simpler and more in tune with changing times and international practices. The government will get some of this work done through formal committees and some in house.

Some initiatives in this regard may be mentioned. A committee will be appointed to review the Monopolies and Restrictive Trade Practices Act, and suggest a law relating to competition. Two committees will be appointed to review the drug policy and identify the support required by the pharmaceutical industry. An expenditure reform commission and a national statistical commission will be constituted.

The Industries (Development and Regulation) Act will be reviewed. In preparation for the next budget, a system of zero-based budgeting will be initiated. Government expenditure on salaries will be pruned by abolishing some posts. A discussion paper on reforms will be prepared.

As a result of these and other initiatives, revenue and fiscal deficit will decline in the future. The revenue and fiscal deficits for 1999-2000 are estimated at 2.7 per cent and 4 per cent, respectively. It is suggested that at the recent rates of reduction the revenue deficit will be eliminated in four years and the fiscal deficit brought down to below 2 per cent.

It will take months or even years for concrete measures that will make impact on growth to emerge. Time will be consumed at various stages: appointment of committees, location of office, recruitment of staff, the submission of reports, consideration of the recommendations by the government, follow-up in the shape of laws, rules and regulations, strengthening of existing agencies, creating new ones where needed, and so on. The impact of the work on the hard numbers of production can be felt only after a fairly long lag, most certainly not in 1999-2000. Secondly, some work has only symbolic value. Thirdly, the government often has second thoughts or develops cold feet during the work period, so that the work is halted or abandoned in midstream. Fourth, some proposals remain on paper for long, ultimately to be buried quietly.

These thoughts are based on hard facts. Consider first, the Industrial Relations Bill, which though it was cleared by the Cabinet seven years ago, has yet to become law. Note next that the abolition of four secretary-level posts announced by the finance minister has only symbolic value in the context of the Pay Commission's recommendation that the number of government employees be reduced by 30 per cent; that the Maharashtra government had initiated zero-based budgeting during the mid seventies but the successor government abandoned it; and that the proposal for the setting up of asset reconstruction companies by banks with a large volume of non-performing assets still exists only on paper.

All in all, even when these reviews and reports culminate in the adoption of concrete measures their impact on production could be felt only after 1999-2000. It must however, be said in fairness, that the proposals discussed in this section provide a basis for the hope of reforms in the medium term.

VII
Larger Concerns

The larger concerns considered here relate to the GDP growth and fiscal deficit numbers of the budget and to the question whether this is a reform-pushing budget.

GDP Growth

The budget has pegged real GDP growth at 7 per cent on the assumptions of market price growth of 12 per cent and inflation of 5 per cent. In terms of goals, the 7 per cent figure makes sense: the Ninth Five-Year Plan (begun 1997-98) has a target of 6.5 per cent; the average growth of the first two years was 5.4 per cent; and reach-

ing the Plan target of 6.5 per cent would therefore call for an average annual growth of slightly more than 7 per cent during the last three years of the Plan period. But considering the experience of 1998-99 and the potential of the 1999-2000 budget proposals, 7 per cent seems to be a tall order.

The rate of GDP growth in 1998-99 was 5.8 per cent, composed of 5.3 per cent for agriculture, 4.7 per cent for industry and 6.7 per cent for services. It would be too much to hope that agriculture growth in 1999-2000 could come close to that figure. After all, the 5.3 per cent growth was on a negative base (minus 1 per cent) in 1997-98. A high growth rate on a low base is understandable, but fast growth on a high base occurs rarely. Also, agricultural growth is subject to wide year-to-year fluctuations: it will be noticed from Table 1 that agricultural growth was high in 1994-95 (5.4 per cent), fell in 1995-96 (0.2 per cent), went up in 1996-97 (9.4 per cent), declined again in 1997-98 (–1 per cent) and rose in 1998-99 (5.3 per cent). Thus, only low growth is to be expected in 1999-2000, and our guess is that it will be about 3 per cent. Industrial growth in 1998-99 was 4.7 per cent. As already noted, we envisage an increase to 7 per cent in 1999-2000. Growth in service was 6.7 per cent in 1998-99. We put it at 7.5 per cent for 1999-2000. This higher rate is warranted, among other things, by the consideration that the government and the organised sector as a whole will have to yield to the demands for increased wages and salaries of their workers, who have been agitating in various ways for some time. Thus, our guesses for agriculture, industry and services are 3, 7 and 7.5 per cent. Given the respective weights in the IIP of 30, 30, 40, we get an overall GDP growth of 6 per cent for 1999-2000. This is admittedly a very rough exercise having only indicative value.

If the actual number turns out to be around 6 per cent, the year 1999-2000 would be more or less on a par with 1998-99. Incidentally, this would necessitate GDP growth at the rate of nearly 8 per cent during last two years of the Plan if the Ninth Plan target of 6.5 per cent is to be hit.

Fiscal Deficit

We may recall that the budget for 1998-99 had estimated the fiscal deficit at 5.6 per cent of GDP. We are now advised that it would be 6.5 per cent. These numbers represent GDP growth reckoned at 1980-81 prices, and they include all small savings schemes.

The budget has estimated the fiscal deficit for 1999-2000 at 4 per cent. This is worked out from GDP growth computed at 1993-94 prices. This new series estimate is about 9 per cent, higher than the old series (1980-81 price) estimate. Secondly, a system of transferring 75 per cent of the net small saving collections to states/union territories from the Public Account will now be introduced. These two changes have had the effect of inflating the denominator (GDP) and deflating a part of the numerator (expenditure). Thus we have a more presentable number of 4 per cent for the 1999-2000 fiscal deficit.

What is the credibility of this number? Past experience suggests that the actual fiscal deficits for almost all the years since 1991-92 have exceeded the budget estimates. It would seem that finance ministers are prone to play some tricks in budget-making: a larger number than warranted for revenue and a smaller number for expenditure in the numerator, and a larger number for GDP in the denominator. This trick has almost always been exposed by the time the year runs out. Going by the past experience, one may guess that the year will end with a fiscal deficit of 5 per cent or thereabouts.

Reforms

On the question of reforms, there is absence of focus in the budget. Some of the proposals roll back reforms. Some push them. Some are reform-neutral. And some others are reform-promising. The increase in customs duties and the surcharge on income tax belong to the first category. The simplification of the procedures for tax compliance and the rationalisation of the indirect tax structure belong to the second category. The excise duty proposals, revenue-neutral in totality, and the retention of subsidies belong to the third category. The reform-promising category is dealt with in Section VI.

On balance, it would seem that this budget does not have much by way of reforms such as would have an impact on GDP growth in 1999-2000. On the other hand, there is a lot of spadework for reforms to be initiated in 1999-2000. As suggested in Section VI, however, the impact of this work may be felt only after 1999-2000. In a word, this is not a reform-pushing budget, but a budget that provides hope for a modicum of reform in the medium term.

VIII
Concluding Remarks

Our discussion led us to conclude that the 1999-2000 budget proposals which related indirectly to the industrial sector as a whole or to specific sub-sectors would have a moderate impact on industrial growth during the year but that those proposals which were directly related to these entities would have a relatively minor impact.

On the basis of 'guesstimates' of the respective impacts of the different sets of proposals, we arrived at the tentative conclusion that GDP growth of industry in 1999-2000 would be 7 per cent.

Out discussion also covered the larger question of GDP growth, fiscal deficit and reforms. Whereas the budget estimates an overall GDP growth in 1999-2000 of 7 per cent, our guesstimate was 6 per cent, only marginally higher than the figure for 1998-99. It led us to the implication that GDP would have to rise at an average rate of 8 per cent during the last two years (2000-01 and 2001-02) of the Ninth Plan.

Whereas the budget estimates the fiscal deficit for 1999-2000 at 4 per cent, our tentative estimate is 5 per cent. We base this estimate on our expectation that GDP growth will fall short of the corresponding budget estimate and, partly as a result of this, the revenue deficit will be larger than estimated in the budget.

Our discussion also led us to the conclusion that this budget does not push reforms but holds out the promise of reforms in the medium term.

The Serbian Hegemony, Ethnic Heterogeneity and Yugoslav Break-Up

Dawa Norbu

Despite serious attempts at rectification, the federative system of Yugoslavia, as was nurtured by its first premier Josip Broz Tito in the post-second world war period, exploded by 1990-91. The tenacity of ethnicity and finely differentiated versions of south Slav nationalism, sharpened by frequent foreign imperial dominations of the region in the past, defeated Tito's design as well as international efforts to save Yugoslavia from Balkanisation. Instead of integrating the eight ethnic groups comprising Yugoslavia into a single nation, certain political and economic dynamics of the federal system tended to unintentionally reinforce ethnic nationalism within each federal unit, especially the larger and more assertive ones. The serbian domination of the state power structure, unwarranted by population size or economic strength, provoked the assertion of non-serbian ethnic identities. If the croats and the slovenes succeeded in achieving a state and an economy of their own within the parameters of a nation, the Bosnian Muslims and the Kosovo Albanians became victims of the serbian repression unleashed against them.

PERHAPS more than the west Slavs, south Slavs constitute one of the most delayed cases of nation-formation in western history. Extreme ethnic heterogeneity characterised the artificial composition of the former. Yugoslavia held together not by commonly accepted 'gevens' of nationhood but by coercive ideology Tito's personality and sheer force when necessary.

The south Slavs' delay in nation-formation may be primarily due to their geo-strategic location within the European international system. They were situated at the crossroads of empires, international politics and war, which disrupted the historical processes, and distorted the politico-cultural patterns of nation-formation in the Balkans. During 395-1453 AD, they were under the Roman empire; during 1389-1918, under the Ottoman empire; between 1815-1918, under the Austro-Hungarian empire. With the collapse of the Austro-Hungarian and Ottoman empires in the course of the first world war, "the allies at Versailles decided on the creation of an independent south Slav state".[1] In other words, it was not so much of the will of the south Slavs but an international political intervention that created the first Yugoslav state in 1918.

A similar pattern of external interventions influenced even the formation of cultural identities of the south Slavs. Yugoslav literally means the 'south Slavs', "series of tribes, that migrated into the Balkan region from the north-east beginning in the seventh century".[2] Through the Middle Ages a number of medieval petty kingdoms evolved in the region with no definite boundaries, which often overlapped each other. Most well known of them were serbian, croatian and Bulgarian kingdoms They remained largely unaffected by world religions until they encountered imperialism which introduced world religions in the area. "Those south Slavs living within the Austro-Hungarian empire (that is, most Slovenes and Croats) tended to adopt Roman Catholicism while those south Slavs living within the Ottoman empire tended to adopt eastern orthodox religion (that is most Serbs) or Islam".[3] Once they adopted world religions, each of the significant south Slavs began to define and differentiate their ethnic identities along essentially cultural lines,[4] as so evident since 1990 in the Balkans.

The south Slavs' geo-strategic location within the international system has the following implications to their delayed nation-formation Frequent external interventions such as the Roman, Austrian, Austro-Hungarian, allies and axis ones, tended to disrupt and distort the historical patterns of national development in the region. My assumption is that once an idea-system is invented in or introduced into any society, it needs few centuries to work out its effect on various vital spheres of social life.[5] The consolidation of political and social structures, the formation of national identity and territorial boundary, etc. requires historical time to root themselves in specific soils and societies. This had, unfortunately, not been the history of south Slavs, whose historical development had been continually interrupted by external interventions from 395 AD to 1918 AD. The result had been ethnic fragmentation, not national consolidation except during Tito's rule.

The other function of historical imperialism in the Balkans had been this; while frequent external interventions tended to deprive the south Slavs of indigenous development, they were enough to intensify ethno-historic memories and sharpen their sense of separate identities. The otherness of foreign imperial dominations tended to sharpen ethnic boundaries and solidify ethnic identities. This was particularly true of the dominant ethnic groups such as Serbs, Croats, Slovenes, as we shall see.

For all 1500 years (395-1918 AD) the dominant historical experience of the south Slavs had been not autochthonous development; it was series of imperialisms which sketched ethnic boundaries of various domains and which shaped the core components of ethnic identities. For example, the Balkans were the dividing line between the eastern and western halves of the Roman empire. On the eastern half of the Roman empire were the "lands that became Serbia centuries later and the western side had the precursor of modern Croatia, Slovenia and Bosnia".[6] Culturally, those south Slavs living within the Austro-Hungarian empire, namely, most Slovenes and Croats, tended to adopt Roman Catholicism, while those under the Ottoman empire (most Serbs) tended to adopt the eastern orthodox religion or Islam.[7]

If the cultural and political fallout of imperialism largely defined most of the identities and boundaries in the Balkans, ethnic struggles against such imperialisms tended to crystallise and solidify their identities This was particularly true of Serbs who dominated the south Slav's chequered history up to the modern period. The Serbian hegemony has been one of the main causes of south Slav's brief periods of federal unity as well as of the

Yugoslav disintegration in 1990 and the current ethnic conflicts in the region.

The serbian hegemony owed itself not to economic or demographic reasons.[8] In the absence of material evidence, we are left to speculate along historical lines with sociological imagination: assertive identity, ethnic cohesion, organisational ability and general resourcefulness accumulated over centuries in the heart of the Balkans that might have accounted for the Serbian hegemony or leadership. Neither their population size (38 per cent) nor their economic strength supported their claim to hegemony. It was based on social-cultural factors.

Of all the ethnic groups in the Balkans, serbs were the first to offer an organised and sustained resistance against the Turks. In particular the serbian uprising against the Turkish overlords in 1804 and 1815 "created the framework for the growth of the Serbian state".[9] Serbia continued to expand southward into Kosovo and Mecedonia in three waves (1831-33, 1878 and 1912-13), thereby creating some basis for serbian, if not south slavic, unification.

The opportunity came after first world war when the allies at Versailles decided to create an independent south Slav state. It was called the kingdom of the Serbs, Croats and Slovenes. and held together rather precariously until 1929 by the serbian leadership. As its title suggested, the kingdom recognised only three ethnic groups: Mecedonians, Bosnians, Montenegros and others were not recognised as separate ethnic groups. Yet, this motley of ethnic groups "was built on the theory of one-nation state comprising three south Slavic tribes"[10] – Serbs, Croats and Slovenes. Actually, Yugoslavia between the world wars was really a 'Greater Serbia'.[11]

After the failure of the first attempt at south Slav unification through a multi-party parliamentary democracy (1918-28), the kingdom of Yugoslavia was established in 1929; it lasted until 1941. Again a Serbian king ruled "a unitary state in which the administrative sub-units were given geographic rather than ethnic names. In this and other ways, the regime attempted to foster a 'Yugoslav nationality' in place of the ethnic identities that had so much undermined the previous constitutional order".[12] In the process, the core institutions of the pre-war Serbian state such as the monarchy, army, bureaucracy, church were extended to and imposed upon Croatia. Slovenia, Bosnia, Herzegovina, Kosovo and Macedonia.

The Serbian historical tendency to dominate the Balkan politics and their implicit claim to south Slavic leadership has been challenged by perhaps the next most organised and assertive ethnic group, Croats. To that extent the Yugoslav history in the 20th century has been characterised by Serbo-Croatian rivalry and conflict, evident to this day in Bosnia.

However, some Croat politicians and intelligentsia advocated, pan-south, Slavic ideas in the 1830s. But, when such ideals took the shape of Serbian hegemony, most of them became disillusioned and increasingly turned to Croat nationalism. The Croat nationalists of the interwar period dreamt of the resurrection of a 'Greater Croatia' which would incorporate Croatia proper, most of Bosnia-Herzegovina and Dalmatia.[13]

In 1934, Serbian king Alexander and his foreign minister were assassinated in France by Macedonian and Croat nationalists. Earlier in 1928 the Croatian leader, Stephen Radic and other activists were assassinated by a pan-Serb Montenegrin. After the proclamation of royal dictatorship in 1929, extreme Croatian nationalists went underground and founded *Ustasa*, a fascist group that would co-operate with Hitler for the sake of Croatia's independence. In 1941 when the nazis invaded Yugoslavia, they installed Nedic in Serbia and declared Croatia independent under the *Ustasas*. The *Ustasas* began to exterminate the Serbs from Croatia, by killing one-third, expelling one-third and forcefully converting the rest to Catholicism.[14] Serb insurgents organised themselves as 'Chetniks' (led by Draza Mihailovic) and started attacks against the Croats and Muslims.

Such violent incidents made a deep imprint upon the Serbs. "The memories of the second world war have also generated animosity between the Serbs and the Croats. Due to the *Ustasa* atrocities...all the Croats are painted as fascists".[15] But Franjo Tudjman; the Croatian president in 1990 defended the fascist state of *Ustasas* as a "legitimate manifestation of the historical aspirations of the Croatian people".[16]

In order to understand objectively Tito's Yugoslav federation, we should review it in the perspective of previous attempts at south Slav unification. The first lasted 10 years; it was the only attempt to establish democracy in the Balkans, during which three national elections were held, and 17 cabinets changed hands. Ethnically-based party politics and the serbian dominance wrecked the constitutional order. The second attempt lasted for 11 years. As a reactive response to the previous constitutional anarchy and crisis, it was a serbian royal dictatorship. The second world war, which included the nazi invasion of Yugoslavia, split up the kingdom of Yugoslavia. In 1945-46, Yugoslavia was recreated, this time as a Leninist federal republic. It was led by Josip Broz Tito and lasted for 45 years, the longest period of unification in the history of south Slavs.

Seen from such a perspective, we should ask not only why Tito's federation failed in 1990 but also why it lasted the longest in the Balkans where Balkanisation is endemic. The role of human agency in the historical process is usually slighted in social science discourse. But the establishment and existence of Yugoslavia for more than four decades cannot be acutely understood without reference to Tito's charismatic qualities and his organisational ability. A charismatic leader emerges when a right man meets the right moment of crisis which he tackles with dramatic success. Tito did just that. Under his able leadership, "the communists on the whole proved to be patriotic, well-organised, and politically and militarily more successful, in the liberation struggle and in the civil war than opponents".[17] Out of such heroic deeds, a powerful national myth was born: "that Tito (a Croat) had led the multi-ethnic partisans as their numbers and units eventually spread throughout Yugoslavia and as they achieved liberation from the occupying forces, thus proving that the south Slavs could collaborate successfully as Yugoslavs".[18]

Tito's international stature was enhanced by two factors. As he challenged the Soviet monolithic power and fought hard for Yugoslavia's right to follow its own road to socialism, he won western encouragement and acclaim during the height of the cold war. Secondly, his leadership in the non-aligned movement generated much third world admiration for him personally and popular support for his country. Thus, a Yugoslav defector in the late sixties noted that "It was Tito's power which radiated through and permeated Yugoslav life in its entirety".[19] But as Tito's charisma began to wane and as ethnic problems intensified by early seventies, he increasingly resorted to coercive means. Progressively his dream of Yugoslav nationality turned into a Balkan nightmare.

Although Tito appeared during his lifetime as a deviant Leninist, yet he shared several fundamental features of Leninism especially his belief in the 'socialist federation' as a final solution to the nationality question. In this regard he envisaged the Leninist conception of federation as an instrument to transform various ethnic groups into a single Yugoslav nation. Since

such utopian transformation would take a long time, he envisaged a transitional federation based on 'ethnic equality'. But his transitional management became an existential history of unequals which wrecked his system. Tito was more explicit about his ultimate Yugoslav goal when he said, "I would like to live to see the day when Yugoslavia would become amalgamated into a firm community, when she would no longer be a formal community but a community of a single Yugoslav nation".[20] In retrospect, it appears that he was probably the first and the last believing Yugoslav. His utopia, partly inspired by pan-south Slav nationalism and partly by the Leninist vision, was overtaken by the sheer tenacity of ethnicity.

Tito's socialist federation was largely based on the Soviet quasi-federal system, with minor modifications. Sensitive to the ethnic divisions within the Balkans, he established a federation of six republics – Slovenia, Croatia, Serbia, Bosnia-Herzegovina, Montenegro and Macedonia. Each of them was granted regional autonomy within a single state which retained foreign affairs, defence and some joint economic concerns under its sovereign jurisdiction But this federal structure ensured neither inter-ethnic coexistence nor prepared the various ethnic groups for the 'final' amalgamation into a single Yugoslav nation. Each ethnic group travelled invisibly but surely more or less along the historical grooves dug deep for centuries by separate ethnicity, becoming ever conscious of its ethnic identity as material stakes increased. The tragedy was that, like the Soviets and Czechoslovaks, the Yugoslav communists believed that their socialist "revolution resolved the National Question in Yugoslavia once and for all".[21] Such an idealistic belief in Marxian utopia blinded the communists in Yugoslavia (like elsewhere) to the social reality of ethnicity and finely differentiated versions of neo-nationalism. The fact was, as Gary Bertsch observed in 1977, "Yugoslavia is a country with six republics, five peoples, four languages, three religions, two alphabets, and one Yugoslav – Tito" [22]

What then went wrong with the Yugoslav federation? It was not due to a lack of good intentions and partial popular support especially during the initial stages. Nor was there a lack of effort to correct the system in the 1970s. The war generated waves of pan-south Slav feelings and Tito remained till the end a convinced Yugoslav, even though he was a Croat. The 1946 Constitution did not exaggerate much when it described the new federation as "a community of peoples equal in rights, who on the basis of self-determination, including the right of secession, have expressed their will to live together in a federative state".[23] As for corrective changes in the federal system, Tito and his associates proved to be more responsive than the Soviet counterparts. New constitutions and constitutional laws were made in 1946, 1953, 1963 and 1974, borrowing heavily from the Swiss and American constitutions.[24] In 1974 Tito gave up his life-term presidency, and was replaced by an eight-person collective presidency, with each of the eight representing one of the eight federal units. The federal assembly was also composed of delegates from each of the eight units – six republics and two autonomous regions.

Despite such serious attempts at rectification, the federative system exploded by 1990-91. The reasons are, as current history indicates, fundamentally due to the tenacity of ethnicity and finely differentiated versions of south-Slav nationalism. The irony was that, instead of integrating the eight ethnic groups into a single Yugoslav nation, certain political and economic dynamics of the federal system tended to unintentionally reinforce ethnicity and ethnic nationalism within each federal unit, especially the larger and more assertive units. I refer to the Serbian domination of the state power structure at the federal level, unwarranted by population size or economic strength, which provoked the assertion of non-Serbian ethnic identities As the Serbians continued to dominate, if not monopolised, the federal power structure, each non-Serbian republic and autonomous region was compelled to fend for itself, using whatever resources granted to the republics and regions. In particular the 1974 Constitution granted each republic maximum autonomy in solving local problems and developing strengths. "The result was that the republics began to develop independent economies."[25] As each republic pursued independent economic policy, it indirectly encouraged an ethnically-based autonomous development in almost all the 'federal' units This meant each republic and province developed its own separate, if not nationalistic, economy, institutions and local elites who began to advocate ethnic nationalism

Yet while the Constitution recognised the autonomy of each nation (republic) except foreign affairs and defence, the expression of nationalism was severely and squarely prohibited as a matter of ideology and policy. For several decades the public articulation of ethnic nationalism was suppressed. So were "numerous other manifestations of national feelings and identity, such as the use of national names for institutions, some songs, writings by some famous authors, visual symbols, national flags, etc".[26] Thus, by 1981 only 5 per cent of the 22.4 million people considered themselves as Yugoslavs.[27] Probably, from mid-forties to late-sixties Yugoslavia was held together by a combination of Tito's charisma and partisan solidarity; after that, by 'federal' coercion and serbian supremacy.

The Serbian hegemony among south Slavs has been, as we have observed earlier, a historical tendency. This hegemony has two functions: in times of crisis it provided leadership but in times of peace it generated anti-serbian resentment. Even during the inter-war period, the Serbian dominance in the state power structure was clear and well documented. Despite the Croatian reputation for military prowess, on the eve of first world war, out of 165 Yugolsav generals, 161 were serbs while Croats and Slovenes had two each. Similarly, the serbs dominated the state apparatus: office of the Premier, 13 out of 13; royal court, 30 out of 31; ministry of interior, 113 out of 127; ministry of foreign affairs, 180 out of 219; ministry of education, 150 out of 156; ministry of justice, 116 out of 137; transport ministry, 15 out of 26; State Mortgage Bank, 196 out of 200.[28]

It is interesting to note that even Tito, a Croat, and his interventionist ideology premised upon ethnic equality could not check the Serbian historical tendency for hegemony. To be sure, the Serbian representation in Tito's Yugoslav state power structure was less than that of the inter-war period but still in comparison to their total population, the Serbs were rather over-represented. The Serbs, though forming only 39.7 per cent of the total Yugoslav population, held 66.6 per cent of all positions of power in the federal organs of government. [29] Although the Communist Party (the League of Communists of Yugoslavia, LCY) may be considered a model of equitable ethnic representation, the Serbs are again clearly over-represented. They constituted 49.4 per cent of the total LCY membership [30] The trend was similar in the republics too. In 1968 Serbs formed 26 per cent of the Croatian Communist Party when they formed only 15 per cent of the population in Croatia. In 1971 S[illegible] constituted 46 per cent of all generals and 60.5 per cent of all officers. In 1991 Census, the Serbs who formed 39.7 per cent of the population, provided 60 per cent of the officers.

In short the Serbian hegemony was established "in the entire federal party, police and military apparatus, in the civil service, diplomacy, central banking". Their political hegemony in the crucial sectors of the state enabled the serbs "getting expensive systems of subsidies and veteran positions, allocating federal appropriations and central bank credits, securing lucrative contracts with foreign state-owned enterprises, obtaining foreign aid, and better paid positions abroad".[31]

Federalism could be misleading. It does not mean the absence of a centralised state. Even if we agree that the state exists even in a federal system monopolising core areas of national power such as defence, foreign offices, macro-economy, it does not mean, as the Yugoslav case clearly illustrates, that there is a proportionate representation of all ethnic groups of the federation in the state apparatus. The state even in a federal system is progressively ethnicised as the Yugoslav and other cases confirm.

Such privileges and power that the serbs enjoyed and abused were justified by Belgrade in terms of Serbian state nationalism: south Slavic solidarity and serious threats to Yugoslavia's very existence. The fact is that it was not external intervention this time that blew up Yugolsavia, it was an internally and consistently generated political contradiction that exploded Tito's federal system, despite his best efforts. I refer to the Serbian-dominated state power structure at Belgrade and its lack of congruence with the multi-ethnic character of the Yugolsav social system. This contradiction generated ethnic nationalisms that opposed Serbian domination. In the ultimate analysis (if there is such thing in the Balkan case), it is the tenacity and resilience of ethnicity as a 'volksgeist' (not the dialectics of history) that defied Tito's rational design and opposed Serbian domination.

In 1990 Yugoslavia could possibly still have survived "if it were quickly reorganised into an association of sovereign republics".[32] In mid-1990 this was a Slovenian proposal; later, a joint Slovenian-Croatian proposal; and later still, a separate Croatian draft. Much earlier they tried for substantive changes but the Serbian-dominated Communist Party prevented any serious political reforms. Till the end the Serbian elites and ordinary Serbs "never understood and intimately accepted the principle of equality" among all the nations and nationalities in Yugoslavia.[33] Instead, the grievances of serbs living outside Serbia were highlighted by the Serbian mass media to justify territorial expansion and genocide against non-Serbs" in the Balkans.

Such actions have had a vicious demonstration effect on other ethnic groups who would react and retaliate in a similar manner and measure as so evident today in Bosnia. For the fact is that almost all the ethnic groups are so scattered and mixed throughout the former Yugoslavia that even each of the former republics could claim at the most a majority but not absolute majority within its ethno-homeland. For example, the serb population in the Republic of Serbia was as follows: Serbia proper, 85 per cent; the Autonomous province of Vojvodina, 54 per cent and 19 per cent Hungarians; the autonomous province of Kosovo, 77 per cent Albanians and 13 per cent Serbs. The only republic with no substantial minority ethnic group was Slovenia with 91 per cent Slovenes. Otherwise Croatia had 12 per cent Serb minority; Montenegro, 13 per cent Muslims and 6 per cent Albanians; Macedonia, 20 per cent Albanians and 5 per cent Turks. Bosnia and Herzegovina had by 1981 more mixed population than Vojvodina and Kosovo: 40 per cent Muslims, 32 per cent Serbs and 18 per cent croats. Hence, the most bloody ethnic conflict is going on in Bosnia.

Not only in Bosnia but throughout the Balkans each of the significant ethnic groups began to assert its ethnic identity, mobilise its ethnic constituency through nationalistic appeals and finally fought for its independence.

Slovenes perceive themseleves to be central Europeans, not Balkans. They had a million years of culture contact with and influence from Italian and German speaking neighbours. Slovenes are Roman Catholics, and have their own language which became the core component of Slovene identity. They are the most homogeneous nation in the Balkans. Being relatively richer than other regions, little Slovenia used to make the biggest contribution to the federal budget in Yugoslavia.[34] It is then little wonder that Slovenia was the first to declare its independence on July 2, 1990. In plebiscite on sovereignty and independence, 88.5 per cent of slovenes favoured independence.

Croats are also Roman Catholics, and their line of cultural differentiation has been language-based one. In 1967 they fought for the recognition of Croatian with Latin alphabets as distinct from Serbo-Croatian. Their historical memories of independence during the second world war despite fascist associations, are strong among the Croats. The Croat coat-of-arms and flag are similar to those used by the fascist supported independent state of Croatia in the 1940s. In 1971 Tito had to purge the Croatian nationalists. However, by April 1990 their party led by Franjo Tudjman came to power, winning two-thirds of the Croatian assembly seats. The Croatian nationalist activities perturbed the Serbs in Croatia and Serbia, especially when dual script road signs were torn down even in Serbian dominated areas. Croatian Serbs were disarmed and asked to sign loyalty oaths to Croatia. The Serbo-Croatian conflict began in early 1990.

We have earlier traced the dominant role played by the serbs in Balkan history and politics. Their sense of nationalism is rooted in the historic tradition of Serbia as "the torch bearer of Slavism against the Turks".[35] The idea of Yugoslavia as such had been essentially Serbian, based upon linguistic and cultural affinities between Serbs and Montenegrins including those Serb speaking groups in Bosnia and Herzegovina. Hence, the Serbs resented the 'loss' of Kosovo and Vojvodina, carved out of Serbia as autonomous provinces by the 1974 Constitution. Serbs attach deep emotive significance to Kosovo and Vojvodina which constitutes the historical dimension of their national identity.

"The battle of Kosovo was never finished. It is as if the Serbian people have waged only one battle – by widening the Kosovo charnel house, by aiding wailing upon wailing, by counting new martyrs to the martyrs of Kosovo... Kosovo is the costliest Serbian word. It was paid by the blood of the whole people... Here the conscience of the Serb people was split into the period before and after Kosovo. Kosovo is the Serbianised story of the flood – the Serbian New Testament."[36]

It is in this sense that the early manifestations of ethnic nationalism and conflict in Yugoslavia as such may be traced to the Kosovo street protests of 1981. In that year the Albanian demonstrations shook Kosovo. In reaction, Serbs began a campaign against Tito's constitution of 1974 which sanctioned the "dismemberment" of Serbia. Serbian intellectuals in 1986 accused Tito of pursuing a consistent policy of discrimination against the Serbs and Serbia.[37] In 1986 Slobodan Milosovic became the communist head of Serbia and soon gained reputation as the protector of the Serbs in Kosovo. As a staunch Serbian nationalist, Milosovic may be considered one of the causes of the bloody ethnic conflict in Yugoslavia. He despatched the Yugoslav army to Slovenia when the latter declared its independence on July 25, 1991. After the army's with-

drawal from Slovenia, the war in Croatia began. A full-scale serbian campaign of terror against non-Serbian social groups (deportation, genocide and ethnic cleansing) – began.

Traditionally Kosovo has been the ethnohomeland of Albanians. Most Albanians are Muslims and their language is of the Indo-European origin. They deeply resented Serbian hegemony both in Kosovo and Belgrade; it is one of the dynamics of Albanian Islamic nationalism. Following Tito's death in 1981, the Albanians revolted; their slogan was "We are Albanians not Yugoslavs!" During the period 1981-85, some 3,344 Albanians were imprisoned for nationalist activities.[38] After the Albanian riot of 1990, Serbian repression and Albanian resentment intensified almost in equal proportion. Between 1988 and 1990 some 5,000 Albanian officers in the Kosovo administration were purged.[39] In July 1990 Milosovic dismissed Kosovo's parliament, banned most of the Albanian language mass media. These repressive measures compelled the Albanian Muslims to declare their independence in September 1990.

The serbs also have had close cultural ties with Vojvodina. During the Turkish occupation of Serbia and the second world war, Serb refugees in Vojvodina kept their national culture alive. Moreover, Serbs constituted 54 per cent of the Vojvodinan population with 19 per cent ethnic Hungarians. The Hungarian minority often argued that their culture and media were serbianised. Moreover, Milosovic's Serbian ethnocentricity and pro-Serbian policy led to the further increased use of Serbian language and alphabet in Vojvodina, which naturally caused apprehensions in the minds of Hungarians, Slovaks and others. The Hungarians formed the Democratic Union of Hungarians in Vojvodina, which fights for their ethnic interests.

Macedonians speak a language between Serbian and Bulgarian. They are orthodox Christians. Tito recognised their nationhood based on distinct language, history and culture. He even established a separate Macedonian Orthodox Church. But Bulgaria perceives the south Slav inhabitants of Macedonia as Bulgarians. The recent resurgence of Serbian nationalism led to the founding of pro-Bulgarian Democratic Party of Macedonian National Unity similar to Internal Macedonian Revolutionary Organisation which during the inter-war period, agitated for Macedonia's union with Bulgaria. In 1992 the Macedonians voted in a plebiscite (September 1991) for sovereignty.

What is happening in Bosnia-Herzegovina reflects the enlarged picture of ethnic conflicts that have engulfed the Balkans since 1990. It is "a country where the three worlds meet... Islam, Orthodoxy and Catholicism, the east, Byzance (Byzantine) and Europe"[40] lived and now conflict with each other. The Muslims were recognised as a nation in 1968, after 25 years of debate and hesitation. As inter-ethnic tensions built up and ethnic conflicts began, the Muslims tended to increasingly emphasise their religion which they believe constitutes the core of their ethnic identity.[41] In November 1990 free elections, the Muslim Party of Democratic Action won 86 seats in the 240 seat National Assembly; the Serbian Democratic Party, 72 seats; and the Croatian Democratic Party, 44 seats. In March 1992 a referendum was held on the question: "Are you in favour of a sovereign and independent Bosnia-Herzegovina, a state of equal citizens and nations of Muslims, Serbs, Croats and others who live in it?[42] Although the Serbs boycotted the referendum, 99.4 per cent of the participants voted in favour. But the serbian army almost immediately intervened, deploying nearly 95,000 troops. By 1993 the serb forces have established control over 70 per cent and the Croats over 15 per cent of the Bosnian territory. With no co-ethnicists in the vicinity, the Bosnian Muslims are the clear losers in this multi-pronged ethnic struggle for identity and territory in the Balkans.

The Balkans are more of a breeding ground for ethnic heterogeneity than south Slavic unity. More than the west or east Slavs, the south Slavs are particularly an instructive case for the study of ethnicity within a context of multiple identities. Like other Slavs in west and east, south slavs *seem* to share several commonalities such as race, culture, language. However, a deeper analysis reveals that such commonalities fade into the background; what is foregrounded are specific ethno-cultures, ethno-histories, ethno-languages which finely differentiate, both subjectively and objectively, each of the sex ethnic groups in 'Yugoslavia'. It is a typical case of ethnic formation and assertion: the centrality of marginalities. Basic commonalities which might unite are ignored; minor differences which form the substratum of ethnic identity are emphasised such as language, culture and history. Thus, the Bosnian Muslims tend to emphasise religion as the core of their ethnic identity; the slovenes croats and Macedonians, their languages; the serbs, their history. Given a number of ethnic variables, one that most sharply differentiates ethnic self from generalised others around it, is most emphasised and projected as the defining characteristic of the ethnic group in question.

If one generalisation is possible about south Slavic identities, it may be this: As the Serbo-Croatian rivalry indicates the Serbian and Croatian identities are most differentiated from each other on the basis of religion and language. Others may be considered subcategories of these two basic categories of ethnic differentiation among the south Slavs except the Muslims. Croats and Slovenes in the north are largely Roman Catholics and both use Roman alphabets. However, their speech and writing system slightly differ. Ethnicity makes even dialects into independent languages. On the whole, the Serbs, Macedonians, Montenegrins, Bosnians, and other minorities differ fundamentally from Croats and Slovenes. The Serbs, Macedonians and Montenegrins follow the Eastern Orthodox Christianity, while the Bosnians are mostly Muslims. Most of the southern ethnic groups use their Cyrillic characters except the Macedonians.

Even these two basic categories, based on the north-south divide, do not exhaust the process of ethnic differentiation. When ethnicity is politicised and ethnic identities are asserted, what determines are the specific *local* or ethnic versions of religion, language and history which constitute or reconstitute differentiated ethnic identities. In the sense ethno-culture, ethno-language and ethno-history represent the specific and particular ethnic experiences of religion, language and history over a long period of time within an ethno-homeland – by a particular ethnic group. In other words, what is important is the *localisation* of religion, language and history which sum up significant collective or social experiences of a particular ethnic group and therefore, constitute its own ethnic identity. For examples, the Serbs follow the eastern (Russian) orthodox religion but it is not the Russian Orthodox Church that they accept; they have the Serbian Orthodox Church. It may be assumed that since the Montenegrins are religiously and linguistically closely related to the Serbs, they might have accepted the Serbian Orthodox Church. "In fact, the Montenegrins are opposed to the renewed activities of the Serbian Orthodox Church and recently there have been calls for the re-establishment of the Montenegrin Orthodox Church."[43]

Therefore, the fundamental feature of ethnic nationalism is the painful and pride-building process of reclaiming social

selfhood in the vital sectors of public life. And ethnic conflict, which engulfed the Balkans, is an armed struggle for identity and territory in ethnically mixed areas. It is sustained by co-ethnicists dominant in compact territories. This is what makes it truly ethnic conflict.

In the end we cannot overemphasise the fact it was the veracity and tenacity of ethnicity, the progressive assertion of ethnic identities and the societal articulation of ethnic nationalisms that defeated Tito's rational design and international efforts to save Yugoslavia from Balkanisation. Tito's various efforts to reform the Balkanising federation in the 1970s have already been enumerated earlier.

In conclusion we mention the various international attempts to keep the 'rational design' intact. The European Union and the US exerted pressures and made threats of withholding new credits and non-recognition of secessionist republics. The former in particular made promises of fresh loans and associate membership if it (Yugoslavia) stopped balkanising. Gorbachev's and later Russian attempts at mediation all failed.

Even economic failure during the last 45 years can be only the second cause,[44] not the first which is clearly ethnicity. It appears that rational designs in the Balkans had almost always thwarted by non-rational factors such as ethnicity and ethnic nationalism. To that extent the history of south Slavs, especially the modern period, is not a history of regional integration, no matter how "rational"; it is a progressive unfolding of ethnic identities that demanded that the state and economy be established within the parameters of a nation (or an ethnic group). In Yugoslavia Leninism faced perhaps the severest test of its transnational credentials and rational designs.

Economic Development and Political Democracy

Dhanmanjiri Sathe

DEEPAK NAYYAR in his article 'Economic Development and Political Democracy: Economics and Politics in Independent India' (*EPW*, December 5-11, 1998) has traced the interactions between economics and politics in independent India. With regard to the current context he states that "the need for conflict resolution is greater than ever before. But the task has become more difficult". In this note we have made an attempt to identify and discuss some of the issues which are likely to be important in a liberalising India, or for that matter any developing and liberalising economy.

Most of the developing economies were following a planned path of growth and over a period of time most of them have moved towards a more market-oriented system. This pattern can be seen in economies like South Korea, China, Mexico, Brazil, Pakistan and India, along with erstwhile USSR and eastern Europe. In India, as in many of the developing economies, three issues seem to be emerging in the liberalising period.

The first is that of the incentive structure and the resultant efficiency. Though efficiency has always been perceived as important, its single-minded pursuit has become an important part of the current agenda.

The planning process in India did not fully deliver what it was supposed to deliver. On the one hand, it did not raise the size of the cake available in enough measure; on the other, the distribution of the cake was also not egalitarian (more on it later). While the Second and Third Plan showed high rates of growth, after that the economy started doing badly. The decade of the seventies was a period when the state did not have enough to invest nor was the private sector allowed to expand. The benefits from the planning process, which were substantial till 1970, started petering out after that. This situation came about largely because the public sector was not giving adequate returns, that is, the efficiency criterion was totally ignored. This phase continued till the mid-eighties when Rajiv Gandhi became prime minister. Though it was not accepted in explicit terms that the time to make an ideological shift had come, the process of liberalisation was under way in a surreptitious manner after Rajiv Gandhi came to power. This period can be called that of 'economic adventurism', when external and internal public spending went out of control. The high level of public spending was financed out of external and internal borrowing. This was the way out which the government found, because after all for how long can you tax the people heavily, get moderate rates of growth adn totally ignore the productivity or efficiency criterion? The inevitable consequence of excess spending was the crisis of 1991, which made the need for external and internal liberalisation very urgent. The crisis made it easy for the government to 'sell' liberalisation to its people, and the process of liberalisation was accepted as a necessity – something which had to be done for the sheer survival of the economy.

Liberalisation means that the 'market' gets a central place and that the prices are right. That is, the relative scarcities in the economy must be reflected in the prices and not to be suppressed by governmental control. In the same vein, the crux of the market economy is that economic agents who are more efficient should get higher rewards. Higher rewards, in turn, act as an incentive for the economic agents to produce more and to become more efficient. Thus there is clearly a positive relationship between the incentive structure and the generation of wealth in the economy. Acceptance of this has important implications for the Indian economy, polity and the society.

Indian society has been and continues to be a hierarchical and caste conscious society. The 50 years of democracy have not made any dent in this fundamental nature of the society. Thus the new work ethos being sought to be introduced in the still largely feudal and semi-feudal society will have important social implications. For example, the concept of efficiency and the social stratification on the basis of caste are bound to clash. The acceptance of the primacy of the individual as against the tribe or the caste will lead to intra-caste or tribe anxieties. A proper incentive structure which is so very essential for the market-mechanism to operate properly could be socially disruptive. For example, some sections in the Indian economy, like the software professionals, management graduates working for the MNCs, etc, have been getting remuneration which is exorbitant and totally out of line with that being earned in the rest of the sections. This misalignment, which is the crux of the market mechanism, would lead to differential patterns of consumption in society and is bound to have a negative impact on the rest of the society.

The second issue is that of social sector development and social security. As an economy moves towards a more liberalised, competitive regime, immediately the question of those who may not survive the competition becomes pertinent. It is here that political democracy can and should play a crucial role. In India, in the fifties, the fact that the country had a democracy did not lead to any redistribution of assets, like land. This was largely a result of the nature of the Congress Party, which put democracy firmly in place but was reluctant to make any dent in the vested interests structure. This stands in contrast with the experiences of China, South Korea and Taiwan who, for different reasons, had redistributed landholdings before the commencement of the developmental process. This has meant that when they started with the process of liberalisation later on, their asset distribution was much more egalitarian than what it is now in India. And here we must also include the distribution of education and health services, i e, investment in the human resources which allows people to compete in a far better way, which again is much better in these economies as compared to India.

In India, what we see is that a highly skewed income distribution was not rectified by the planning process and the movement towards the market is very likely to worsen the situation. The market mechanism does not take care of everybody even in the developed economies. While the point is well taken that competition needs to be encouraged in economies like India, the point of dispute is what happens to the poor. This is the difference between different political parties in India, because either explicitly or implicitly they have all accepted the process of liberalistion.

In the pre-liberalisation period, especially since the early seventies, the safety net for the poor consisted of the various poverty alleviation programmes,

A tremendous level of co-option of the 'left behind' was achieved at a political level via these 'schemes'. Right now the safety net for the poor and the unorganised in India has become very weak. The poor have to fend for themselves come what may. In reality, they are at the mercy of nature, the market and the government. In this kind of a situation, those sectors of the economy where labour is surplus, unskilled and uneducated will not be able to face competition. This does not mean that they are incapable of efficiency. Rather, it means that they need some kind of positive discrimination at an economic level before they can face competition. People who are in a hurry to liberalise are in effect asking certain sections of the population to make sacrifices for the others. Besides the moral question of why must one section of the population sacrifice for other sections, at the practical level it may not even work. Historically, many short-term sacrifices have been forced out of people for the sake of a glorious future. In most of these cases, the glorious future never did come; in fact economic conditions always worsened. Politically, it is essential that stability in the economy is maintained so that the liberalisation process may continue. This means that the basic needs of the left behind, the have-nots are satisfied. If the entire society wants the process of 'creative destruction' to continue unabated, the losers will have to be compensated.

But the real problem here is that the Indian government is bankrupt. The more it tries to provide for the poor, the more it would be undermining the move towards the market, i e, efficiency. The left behind sections will have to put up political fights to get more and more of the available cake. Here the role of political and non-political activist organisations becomes crucial. It is not going to be an easy task for these organisations to extract more from the government. The ruling party, on the other hand, since it would like to be re-elected, will have to increase 'efficiency' in the use of funds allocated for social sector development. In short, up till now governments have been saying what they have been doing for the poor, how much of resources have been allocated for this purpose; now they will have to see that the resources actually reach the poor. Thus, how much of the cake the poor actually get will depend, to a large extent, on how vocal and organised they themselves get and what kind of pressure they exert on the political system. It can be mentioned here that, it is a very positive development that politics itself is becoming more *competitive*. That is, the hegemony on the Congress Party is coming under threat – a process which has been under way now for some time and was very much observed when Rajiv Gandhi could not get the required majority and chose to sit in the opposition in 1989. Political parties, which are operating in a highly competitive environment, may have to find dynamic and innovative ways of developing social security systems which actually help the poor and not just announce populist schemes like free electricity, etc. What Digvijay Singh has done in Madhya Pradesh in the last five years is a case in point. However, it also needs to be mentioned that sensitivity to the needs of the poor is not a distinguishing feature of a democracy – totalitarian regimes also need to be sensitive about it and at times have been, in reality, more sensitive about it, as the case of China illustrates. Thus, whether the poorer sections in India will be marginalised or will be helped in first becoming economically strong and then exposed to competition, how much social security they will get, are all largely political questions.

The third issue is that of 'freedom'. The demands for a greater say in the political process of countries have been increasing in most of Africa and Latin America as also in South Korea and China. The Tienanmen Square episode in China and the student unrest in South Korea point towards this burning desire for freedom. What is the nature of this freedom which people want? One could call it political-cultural freedom. It is not only in the political field that people want autonomy. It is a well known fact that in totalitarian regimes, people feel alienated from their surroundings. Even when the basic needs of the people are taken care of, the aspirations of the people have no outlet. In some of these countries, it is observed that there is a shift from totalitarian regimes to democracy and back again. This process has been under way for a couple of decades in Pakistan, Bangladesh, Nigeria and most of Latin America. It is usually the failure of democracy to give stability and a clean governance that has led to the rise of totalitarian regimes. However, a positive fall-out of the process of globalisation is going to be greater and greater demand for autonomy by the people. This happened even in China within a decade of the beginning of the economic liberalisation process. Though the demands of the students were not much, the Tienanmen Square movement was ruthlessly crushed by those in powers. The purpose was to send a message that no change would be accepted in the political system of the country. The same thing was repeated in South Korea. However, in future the people from these countries are going to ask for more and more autonomy and the political regimes will find it increasingly difficult to crush these movements. India, in this sense, is different from most of the other developing countries. Though democracy was imposed in India from the top, it seems to have taken strong roots in the last 50 years. In India what we are likely to have is more and more of democracy for the people who were earlier exercising their rights more in a token manner. Besides this, more and more groups and lobbies would be formed who would be fiercely fighting to get what they desire out of the politico-economic and the social system. Thus issues like release of the film 'Fire', cricket test match with Pakistan and conversions would be strongly contested.

Thus, on the one hand, as the incentive system for the efficient improves, social security for the left-out also has to improve. This would contribute a great deal towards the maintenance of political stability, though it would not assure it. This tension, in fact, comes out very much in the statements and the manner in which Chandrababu Naidu is going about developing Andhra Pradesh. In a recent interview he has said that he does not spend any money on information technology and industry, most of the money there is private capital. According to him, "I am spending real money only in rural areas".

Thus India, like many other similar economies, will have to balance between incentives, social security and political-cultural freedom if the equilibrium between the economy and polity has to be established. What gets precedence at a point of time would largely be a pragmatic question. Thus on each and every issue there would be intense bargaining and some agreement would be reached only to be breached as soon as the ground realities change. The divergent historical evolutions of different countries will play an important role in this process. What will be the role of ideology in all this? Ideology predetermines for us the 'good things' of life and drives us to achieve them. However, it appears that pragmatism would be the name of the game.

New Series of National Accounts Statistics

EPW Research Foundation

I
Introduction

THIS note is a sequel to the comprehensive volume on *National Accounts Statistics of India: 1950-51 to 1996-97* (October 1998) published recently by us. That publication brought together a continuous set of time-series for the entire 47-year period 1950-51 to 1996-97, based on the Central Statistical Organisation's annual estimates of various national accounts aggregates and components with 1980-81 as the base year. This old base-year series has come to an end and the CSO has now replaced it by the revised series of national accounts with 1993-94 as the new base year. This is in conformity with the decision taken some years ago that as far as possible the various index numbers and such other economic statistics will have a common base period. Earlier, the CSO had brought forward the base year of its index numbers of industrial production from 1980-81 to the same 1993-94. But, the index numbers of agricultural production, brought out by the Directorate of Economics and Statistics, Department of Agriculture and Co-operation (Government of India), still suffer the old base of triennium ending 1981-82. So are the index numbers of wholesale prices, which also still carry the same 1981-82 as the base period. Reportedly, the revisions of these statistics were taken up some years ago but they have not as yet seen the light of day.

Insofar as the national accounts statistics are concerned, the CSO has revealed that its base year would henceforth be revised every five years to capture the rapidly changing structural features of the economy. Earlier, the CSO was depending on the population census figures to estimate the size of the workforce which, when multiplied by the estimated value added per worker, gave GDP originating in segments of the various unorganised sectors. Therefore, the base year generally coincided with the decennial census periods, namely, 1970-71, 1980-81, etc. But, the CSO has now begun adopting the workforce estimates as revealed by the quinquennium rounds of employment and unemployment surveys of the National Sample Survey Organisation (NSSO) as they are considered as more accurate, which also makes it possible to shift the base period every five years [Kulshreshtha 1999].

Apparently, as per the recommendations of the three expert groups on agriculture, industry and services sectors, appointed by the CSO in March 1998 (whose reports were submitted in April 1998) and the deliberations of the Advisory Committee on National Accounts Statistics, many improvements have been incorporated in the new series [Kulshreshtha and Kolli 1999]. As explained in Section II, the government officials have also identified a number of data gaps and suspected the possible underestimation of GDP and related estimates. Besides, there have been intensive deliberations, in many official and professional fora, on the proposed adoption by India of various recommendations of the 1993 SNA [See a series of papers in *The Journal of Income and Wealth*, July 1996 and Kulshreshtha, et al, 1998 and 1999; see also Roy Choudhury 1996].[1] Due to some sophisticated data requirements, these SNA recommendations such as those concerning the production boundary, assets boundary and institutional sector accounts can be implemented only in phases.[2]

For the present, we have limited information on the nature of revisions effected in the method of estimation and coverage of industries and sectors in the new series of national accounts. Likewise, as a first shot the revised estimates have been published only for a few of the past years starting with the base year 1993-94. The CSO has promised to bring out both a brochure on the revisions and a publication presenting longer time-series for the past years based on the revised methods and procedures. This note and the accompanying statistical tables present the available information on the nature of revisions and the new data series. To bring out the importance of the revisions, an attempt is made to present the earlier estimates based on the 1980-81 series alongside the revised series for the period 1993-94 to 1996-97. The new series is available generally up to 1997-98, and in some respects, based on quick estimates up to 1998-99.

II
Reported Underestimation of GDP

In recent months, M D Asthana as secretary, department of statistics (GoI), has been exposing, through media coverage and seminar papers and discussions, the perceived data gaps including non-inclusion and undercoverage of products and proposing that GDP was considerably underestimated.[3] In a recent paper, he has identified five major sources of underestimation of GDP from the agricultural sector:

(i) Non-inclusion of production of floriculture, mushrooms and other high valued crops;
(ii) Underestimation of production in the case of fruits and vegetables (as evidenced by onions export), isabgol, guar seeds, black pepper, tea, coffee, meat and other livestock products;
(iii) Non-coverage of area under 3rd and 4th crops in some states since Girdwari is not undertaken there;
(iv) Underestimation of area under different crops as brought out by the scheme of improvement of crop statistics (ICS); and
(v) Use of price data supplied by the states [Asthana 1998a].

Asthana has cited therein products like cashewnuts, coffee, black pepper and isabgol, in which the reported value of production – some even in terms of quantity – has been less than that of exports, and also in which the prices used for the valuation of agricultural commodities have been much less than export prices. What is more, it is also shown in his paper, based on discrepancies noticed as between the estimates of all-India crop area reported by the entries of state primary workers under the ICS and those revealed by its supervisory checks, that there has been a distinct trend of under-reporting of area for all the 10 major crops (ibid). In the latest press release issued on February 12, 1999, the department of statistics (GoI) has summed the situation regarding agricultural statistics thus:

> With reference to the agricultural statistical system in general, there have been problems on the quality of estimates. It is estimated that area enumeration in respect of about 40 per cent of the land under major agricultural crops is unscientific. The old established order was abolished in some states without creating a new one in its place. Productivity measurements in crops, based on crop cutting experiments are in poor shape and leave much to be desired. Previously, the NSSO used to bring out estimates on selected crops but the practice was discontinued after

the two sets of data (official estimates and NSSO estimates) converged. There is a need to restart independent estimation of agriculture production, in the light of present quality of agriculture estimates [DOS 1999].

As for the industrial sector, while the data in respect of the registered manufacturing is considered as fairly accurate, it is the estimates for the unorganised manufacturing which have been the bugbear for the national income estimators, with the information regarding this sector remaining "the weakest in terms of reliability and timeliness, necessitating a range of assumptions when preparing GDP estimates" [Minhas and Roy Choudhury 1998]. In the latest DOS press release referred to above, the weaknesses in the official data in respect of the unregistered manufacturing sector are further highlighted in the following words:

> Since estimates of this sector (unorganised manufacturing sector) are based on workforce estimates, the change is only with reference to introduction of new workforce estimates, based on NSSO surveys and population census, as explained above. In fact, in the revised series, this sector's estimates are less than those presented in the previous series. An alternative set of estimates of small-scale industries, available from the office of the DC(SSI), show that the share of unorganised sector is about 60 per cent of total manufacturing sector. Since the department is not using the figures of DC (SSI), the contribution of unorganised sector, based on the current methodology, is only about 31 per cent of the total sector. This still shows that we are not able to capture the contribution of unorganised sector fully. It is our constant endeavour to include all sector's contribution to the GDP realistically [DOS 1999].

As is known, based on the census frame provided by the Economic Censuses (three having been conducted so far in 1977, 1980 and 1990 and the fourth was done in 1997), the follow-up surveys have been conducted by the CSO on 'directory manufacturing establishments' (DMEs, employing 6-10 persons if using power and 6-20 persons without power) and by the NSSO on 'non-directory manufacturing establishments' (NDMEs, employing less than 6 persons with at least one hired worker) and own-account manufacturing enterprises' (OAMEs, i e, household enterprises not employing hired workers). These have been done to derive the benchmark estimates of value added per worker, which are carried forward for other years by certain physical indicators. Of the three follow-up surveys done so far, namely, in 1978-79, 1984-85 and 1989-90, the data obtained from the first follow-up survey were not considered reliable for the purpose. The results of the 1984-85 survey were found satisfactory and they have been used hitherto continuously for the purpose. We do not as yet know the fate of the 1989-90 survey results.

Likewise, with regard to the estimation of income originating in the unorganised services sector, the CSO officials have questioned the quality of data thrown up by the 'Enterprise Surveys' (directory trading, non-directory trading and trading establishments, for instance) on value added per worker and by the population censuses on the size of workforce [Kulshreshtha and Singh 1998]. Instead, they have suggested (a) the adoption of workforce estimates from the NSSO's quinquennial surveys on employment and unemployment, and (b) introduction of some corrections to the estimates of value added per worker (VAPW) as revealed by the 'Enterprise Surveys'. In the meantime, the DOS launched a survey of enterprises in the month of August 1998 with a view to improving the quality of estimates on value added per worker in the unorganised segment of both manufacturing and services sectors. The survey, to be carried out in four sub-rounds until June 1999, aims to capture VAPW estimates of unorganised sector of all economic activities at one point of time, which are not presently available. Also, for the first time, value added estimates are sought to be attempted through both production and income approaches [see Kulshreshtha and Ghosh 1999].

Some of the Corrections Introduced in the Revised Estimates

Indications are that some of the suggestions contained in the above statements have already been implemented, and some by their very nature can be corrected only in the long run [Kulshreshtha and Kolli 1999]. In Section III below, we have indicated the nature of revisions on which the CSO has gone on record as having been introduced. As we review the revised data in Section IV, we will also have occasions to pinpoint the nature of revisions that have occurred in the estimates of GDP and other national account aggregates as a result of these and possibly other changes introduced in the methodology and compilation procedures.

III
Revisions in the Methodology and Coverage

As stated above, the details of revisions effected in the new series are known in brief and they are listed in Statement A. These revisions can be divided into five broad categories. First, as cited earlier, the estimations of income from unregistered manufacturing and service activities have been done on the basis of the new workforce estimates produced by the NSSO surveys on employment-unemployment instead of the estimates derived from the population censuses. Second, several new products have been included in the revised series. They encompass four major sectors: agricultural and allied activities (several horticultural and floricultural

Statement A: Improvements incorporated in the New Series of National Accounts

Agriculture and Allied Activities

(1) Inclusion of several horticultural and floricultural crops.
(2) Inclusion of production of crops in the foreyard/backyard.
(3) Improvement in the coverage of fuelwood captured from consumption approach.
(4) Improvement in the coverage of marine fish: relating to deep sea fishing and separate evaluation of prawns and shrimps.

Mining and Manufacturing

(5) Inclusion of the activities of private coal mines and coal washeries
(6) Improvement in coverage to take into account the activities relating to repair of locomotives and other rail equipment in totality.
(7) Estimation of income from unregistered manufacturing activities on the basis of the new working force estimates based on the NSS Employment Survey results instead of the population census.
(8) Use of quick estimates of Annual Survey of Industries for 1996-97 and 1997-98.

Banking and Insurance

(9) Improvement in the indicator for constant price estimates of banking.
(10) Improvement in the methodology in the estimation of product from Life Insurance.
(11) Inclusion of services of Employees Provident Fund Organisation.
(12) Allocation of imputed banking charges to industries and final users in totality.

Other Services

(13) Estimation of income from unorganised service activities on the basis of the new working force estimates based on the NSS Employment Survey results instead of the population census.
(14) Inclusion of private communication services.
(15) Inclusion of private activities under TV and Radio.
(16) Capturing the activities of tailoring separately.
(17) Capturing the activities of high value (software, consultancy, etc) business services separately.

crops and crops in the foreyard and backyard); mining (private coal mines and coal washeries); banking and finance (employees' PF organisation); public services in quasi-government bodies (research and scientific institutions); and other services (lottery sales services, private communication services and private activities under television and radio such as cable operators and private TV channels). Third, improvement has been effected in the coverage of existing products like fuelwood captured from consumption approach, marine fish in the area of deep-sea fishing and separate evaluation of prawns and shrimps, activities relating to repair of locomotives and other rail equipment to be covered in totality, and capturing the activities of tailoring and high-value business services (software, consultancy, etc), separately. The fourth set of changes relates to methodological improvements in applying a new indicator for constant price estimates for banking and estimating value added from life insurance, as also in allocation of imputed banking changes to industries and final users in totality. In the existing system of estimation, these imputed bank charges have been partly treated as intermediate consumption of industries and partly as the final consumption of government and the households. Finally, there is a major change in the use of the data generated from the Annual Survey of Industries (ASI). Hitherto, there has been a time-lag of about three years in the publication of the summary results of ASI; hence, for the years for which ASI results were not available, the industrywise estimates of output and GVA were being prepared on the basis of relevant indices of industrial production and wholesale prices and these were subsequently revised when the ASI became available. From now on the key results of ASI will be released with a lag of only about 9 to 10 months [Asthana 1998b]. Accordingly, the latest revision of national accounts has taken into account the quick estimates of the ASI for as late a period as 1996-97 and 1997-98. Besides, incidentally, in contrast to the past practice of releasing only summary results every year and detailed results once in five years, the department of statistics (GOI) will henceforth release detailed results of ASI every year (ibid).

Apart from the above changes, some fresh data sources have also been tapped by the CSO for the new series. For instance, in agriculture, estimates of current repairs, maintenance of fixed assets and other operational costs are now based on the latest 1991-92 results of the All-India Debt and Investment Survey (AIDIS)

IV
Comparison with Old Series

Tables 1 to 12 accompanying this note present all the available national accounts data based on the revised series for the period 1993-94 to 1998-99. Along with the revised series, we have also presented the old series for the period 1993-94 to 1996-97. There were the advance estimates for 1997-98 as per the old series but the same are not presented here as such advance estimates are only for a few items, which are produced before the closure of the relevant financial year and which are based on anticipated levels of agricultural and industrial production, budget estimates of government expenditure and performance of key sectors as available.[4]

As may be seen from Table 1, estimates of different variants of national income (GDP, GNP, NDP and NNP) stand revised upwards by about 9 to 12 per cent, whereas the estimates of private final consumption expenditure (PFCE) have moved up higher by about 14 to 21 per cent in different years and those of domestic saving and capital formation the least by about 3 to 4 per cent each. This has happened because a majority of the new items of economic activity now covered essentially relate to private consumption such as, foreyard and backyard production, floriculture, certain horticultural crops, deep-sea fishing and prawns, private communication services relating to television and radio broadcasting and tailoring services. Significantly, even in absolute terms, the upward revision in PFCE at current prices ranging from Rs 68,312 crore to Rs 151,364 crore has been higher than that in GDP at market prices ranging from Rs 66,203 crore to Rs 132,875 crore. For 1993-94 for which by now almost all firm data are available, the upward revision has been of the order of Rs 66,203 crore or 9 per cent for GDP and Rs 68,312 crore or 13.7 per cent for PFCE. In regard to domestic saving and capital formation, new items covered have hardly had any direct effect on their estimation and the meagre revisions noticed in their absolute numbers may have arisen from what may be called 'scale effects' originating in higher numbers of GDP and from the ongoing practice of updating data sources. In respect of capital formation, however, the revised estimates have turned out to be higher by about 9 to 14 per cent than the old estimates for two years 1993-94 and 1994-95, the reasons for which cannot be discerned until fuller details of the revisions are known.

Data presented in Tables 2 to 4 show that in sectoral GDP, some of the largest revisions, in proportionate terms, have occurred in service sectors, essentially as a result of the inclusion of four new items of communication and high-value business services (see Statement A). The revisions have been over 33 per cent in respect of 'real estate, ownership of dwellings and business services'. To what extent the use of NSSO data on workforce has affected the estimation of income from unorganised services is difficult to gauge in the absence of details. [For the list of service categories for which the application of NSSO workforce is relevant, see CSO 1989: 168-69]. A distinct downward revision of around 10 to 11 per cent has taken place under 'unregistered manufacturing' possibly as a result of the application of the NSSO data on workforce instead of the population census data as hitherto.

Amongst agriculture and allied products, a substantial revision of over one-third has been under 'fishing' following the inclusion of deep-sea fishing and separate valuation of prawns and shrimps. Incorporation of the new items of horticultural and floricultural crops and production of foreyard and backyard crops has helped to raise the size of value added from 'agriculture' by about 8 to 13 per cent

Statement B: Compound Growth Rates

(In per cent per annum)

Industry	New Series (1994-95 to 1997-98)	Old Series (1994-95 to 1997-98)
1 Agriculture, forestry and fishing	3.5	2.1
1.1 Agriculture*	4.9	3.4
2 Industry	9.1	9.1
2.1 Mining and quarrying	5.1	4.5
2.2 Manufacturing	10.0	9.8
2.3 Electricity, gas and water supply	7.1	7.1
3 Services	8.3	8.5
3.1 Construction	5.1	6.2
3.2 Trade, hotels and restaurants*	12.0	11.9
3.3 Transport, storage and communication*	8.9	8.4
3.4 Financing, insurance, realestate and business services	7.5	8.8
3.5 Community, social and personal services	7.8	7.6
4 Total gross domestic product at factor cost	7.1	6.9

Note: * Denotes compound growth rates of three years (1994-95 to 1996-97) as the comparable sectoral data for 1997-98 as per the old series are not available.

(a large revision of 21 per cent in 1996-97 may have been an aberration because, in respect of the old series, the data relate to quick estimates. This feature is true of many other sectors as well).

Growth Rates Generally Unchanged

It is, however, noteworthy that upward revisions in GDP or sectoral GDP revisions have not resulted in any noticeable (or consistent) changes in growth rates; this is also admitted by the DOS in its press release cited above. The overall real GDP growth in 1994-95 was identical in both the series at 7.8 per cent, but in the next two years the revised GDP at 1993-94 prices showed slightly higher growth at 7.6 per cent and 7.8 per cent as compared with those shown by the old numbers at 1980-81 prices at 7.2 per cent and 7.5 per cent, respectively. For 1997-98, on the other hand, the revised data show a lower growth, though fractionally, at 5 per cent as compared with 5.1 per cent revealed by the old series. Thus, the compound growth rate in real GDP for the four-year period 1994-95 to 1997-98 works out fractionally higher at 7.1 per cent per annum in the new series as against 6.9 per cent per annum in the old series. This slightly higher growth in the revised real GDP is the combined result of (i) significantly improved growth rates in agricultural and allied activities (3.5 per cent as against 2.1 per cent), in mining and quarrying (5.1 per cent against 4.5 per cent), and in manufacturing (10 per cent against 9.8 per cent); and (ii) a slightly reduced trend growth in services, which in turn has been the combined effect of higher growth in all services sector items except construction and financing, insurance and real estate (see Table 3; see also Statement B for a summary picture).

In banking, the indicator for constant price estimates, hitherto the aggregate deposits deflated by the wholesale price index, has been replaced; it is also said that a new treatment is being given to the issue department of RBI.

Incidentally, a new phenomenon found in the industrial sector in recent years, not necessarily in the new series, has been that the rate of growth as revealed by the value added figures in real terms in respect of registered manufacturing is higher than the rate of growth shown by the index of industrial production. This is because there have been signs of better material input efficiency (probably also reflecting better capital and labour efficiency) in the registered manufacturing sector, which is indicated in a rising ratio of gross value added in gross value of output [see EPWRF 1998:65].

Changing Sectoral Composition of GDP

In the sectoral composition of GDP, there has occurred a distinct change following the revision: for example, for 1996-97 a sharp 2 percentage points reduction in the proportion of GDP originating in manufacturing from about 19.4 per cent to 17.4 per cent, which has been shared between the services sector (1 percentage point from 53.6 per cent to 54.6 per cent) and agriculture and allied activities (1 percentage point from 27 per cent to 28 per cent). These revisions further confirm what may be called the structural 'stagnation' of the Indian economy in that the share of the manufacturing sector in total GDP has remained less than 18 per cent that was attained in the late 1970s. Since then some improvement has taken place in infrastructure industries like mining and electricity, particularly the latter. Likewise, in the services sector, there has been a slight improvement in the share of physical infrastructure facilities, namely, transport, storage and communications, but the bulk of the increase has been captured by various other services in trade, hotels, finance and business services, and community, social and personal services. Overall, the long-term phenomenon of a decline in the share of agriculture, stagnation in that of industry and a rise in the proportion of services has been reinforced also by the revised series. With significant upward revisions in the estimates of private sector activities, the share of public sector has been eroded as a statistical consequence (Tables 10 to 12).

Downward Revisions in Saving and Investment Ratios

The saving and capital formation estimations in absolute terms do not seem to have been affected to any significant extent by the revision except probably for the ongoing practice of using more recent data. But, as a result of the upward revision in the size of GDP, both domestic saving and investment ratios have been placed lower by about 1.0 to 1.5 percentage points in each of the past five to six years. For instance, for 1996-97, the earlier saving estimation of 26.1 per cent of GDP at current market prices has been slashed to 24.4 per cent and gross domestic capital formation from 27.3 per cent to 25.7 per cent. As a result of these revisions, the saving ratio has only limped forward by 1.3 percentage points from 21.8 per cent in 1993-94 to 23.1 per cent in 1997-98 and the gross investment ratio by 2.4 percentage points from 22.4 per cent to 24.8 per cent (see Statement C and also Tables 6 and 7).

Notes

[Considerable assistance received in the preparation of this note and special statistics from Nandini Sengupta, Cheryl Mascarenhas and V P Prasanth is gratefully acknowledged.]

1 That the data requirements for implementing the 1993 SNA would be quite large is evident from the following summary statement on the subject:
While the implementation of new UN System of National Accounts, 1993 [SNA 1993] and the IMF's Special Data Dissemination Standards (SDDS) will mean collecting a large amount of additional data, the quality and coverage of data that presently goes into the computations of GDP, need considerable improvement.

Statement C : Saving and Investment Ratios

(per cent of GDP at current market prices)

Item	New Series					Old Series			
	1997-98	1996-97	1995-96	1994-95	1993-94	1996-97	1995-96	1994-95	1993-94
1 Gross domestic saving	23.1	24.4	24.1	24.2	21.8	26.1	25.3	25.6	22.7
1.1 Public sector	1.0	1.5	1.9	1.5	0.5	1.9	2.3	1.8	0.6

The SNA 1993 recommends preparation of sequence of accounts for all the institutional sectors into which the economy has divided, namely, (i) non-financial corporations, (ii) financial corporations, (iii) general government, (iv) households, and (v) non-profit institutions serving households. Several satellite accounts including the environmental accounts have also been recommended. The other key features of SNA 1993 are the enlargement of production and assets boundaries of the 1968 SNA. As per the extended production boundary the production of the households for own-account consumption, illegal and underground production are required to be reckoned with in the national accounting framework. The main areas where the satellite accounting framework has been suggested relate to environmental economic accounting, tourism accounting, extended production boundary (gender issues) [Asthana 1998a and 1998b. See also Kulshreshtha, Kolli and Singh 1998, and Kulshreshtha, Kumar and Singh 1999].

2 The United Nations' Statistical Commission recognises "the long and winding road to the full 1993 SNA implementation": it has recommended 6 milestones or phases in this respect. [See *SNA News and Notes*, issue no 4, July 1996. This newsletter, issued as a biannual information service of the Inter-Secretariat Working Group on National Accounts (ISWGNA), is prepared by the Statistics Division of the United Nations; it is available on internet: http://www.imf.org/external/pubs/ft/sna/default.htm or http://www.un.org/Depts/unsd/sna/sna.htm]

3 See interview given by Asthana to the *Business Standard* dated July 24, 1998. To quote him.

> Some of the figures are so absurd that it is certain that the correct GDP is not captured. Now let me tell you why I think GDP is under-reported. Mind you, the professional statisticians who work at the department have known this for a long time. The GDP is contributed to by three sectors. The service sector contributes to 42 per cent of GDP. But all of the IT sector is probably not reflected accurately in this. Similarly your cable man and the TV repairman or any other service that has been in existence for 10 years or less is not captured accurately. We do service sector surveys once in five years whereas other countries do it every quarter. The agriculture sector contributes to about 24 per cent of the GDP. This is even worse represented. The crop calendar for the Department of Agriculture is 32 years old. Several products have been added since and if you go to the respective departments, each one state that India is one of the top five producers of that product in the world. This list of what is not captured in the GDP includes dairy products, poultry, a large part of marine products, vegetables, mushrooms, flowers.
>
> In the industrial sector, the large sector is fairly accurate. But in the small sector we cannot even agree on the number of units across ministries. According to the department of small scale industries, there are 14 to 15 lakh units based on the 1987-88 census. According to the current update there are 60 lakh units. According to excise records there are 32 lakh units with a turnover of more than Rs 30 lakh. Our economic census, which includes household industries, puts the estimate at 140 lakh units [Asthana 1998].

A more radical view has been aired by M R Sivaraman, India's executive director at the International Monetary Fund (IMF), who went to the extent of stating that, "India's real GDP is 60 to 100 per cent more than what is indicated" (see *The Sunday Times of India*, July 5, 1998). In an academic response to these pronouncements, the inference that data gaps necessarily imply serious underestimation of the overall GDP came to be questioned. Stating that Sivaraman's assertions were based on "ill-informed casual empiricism", Minhas, Tendulkar and Visaria (1998) argue that:

> The conclusion arises out of misunderstanding about the concepts, methods and procedures of estimating GDP. Some underestimation of GDP is possible in some of the unorganised activities, whose contribution to GDP is estimated from reported income/earnings because there is a universal tendency (in all countries, not only India) among respondents to income surveys to understate income. In addition, existing data cannot capture certain activities like petty services. However, their importance in GDP is limited. This is because, while such activities loom large in terms of employment and hence in any casual empiricism (of the type favoured by Mr Sivaraman), their contribution to GDP is much smaller because of the very low productivity per worker in such activities. Having been associated periodically with the work of the Central Statistical Organisation for more than two decades, we are familiar with the methods and procedures of GDP estimation and their approximation to the basic concept of national accounts. In our considered judgment, while conceding certain problems with GDP estimation, there is no basis for the allegation of a very large magnitude of underestimation. Mr Sivaraman's statements are misleading, baseless and reflect lack of understanding about the data base of India's GDP.

To which Sivaraman (1998b) responded and chose to charge that "As most of our economists, all these years, have been devoting more attention to studying India's poverty rather than her achievements, their thinking has become warped and disoriented resulting in their seeing nothing but poverty in India". Further, defending himself that his observation on the GDP of India was not casual but was based on discussions with economists and officials of the Central Statistical Organisation (CSO) and on his own observation in the field, Sivaraman enumerated six factors suggesting GDP underestimation: third crop sown in most parts is not taken into account; correct estimation is not done of horticulture, floriculture, farm forestry and pisciculture; gross underestimation of value addition in the small-scale sector; suppression of production in the medium- and large-scale sector for excise tax evasion purposes, value addition in the services sector as a whole is not based on accurate reporting and, that ascribed to workers in medical and health services, legal services and business services is not in accordance with ground realities; and massive import of gold is not accounted for in statistics.

4 For the year 1997-98 in particular, there was an update of *advance estimates* in July 1998, that is, after the closure of that financial year. The sectoral growth rates revealed in this update have been incorporated in the compound growth rates presented in Statement B above.

Vol XXXIV No 15 April 10, 1999

Time, Truth and Play in Dangs

Confronted with pasts imagined differently from history, historians and social scientists have resorted to one of two strategies: by converting moral traditions into the equivalent of archival sources and then writing histories that adhere to the norms of western professional history writing; or by denying any significant traffic between history and other forms of conceiving pasts, subsuming the latter under the rubric of myth or, more recently, memory. In Dangs in Gujarat, 'vadilcha goth' or stories about ancestors are an engagement with modernity and its paradigmatic trope, history. Examination of how this engagement refigures and exceeds modernist time and truth helps to foreground the subaltern factors of anomalous and hybrid histories which in Dangs produces a multiplicity of pasts quite different from the multiple histories which historians conceive of and increasingly call for. **897**

PDS and Real Consumption Levels

Allocation of foodgrains under the Public Distribution System (PDS) has been very ad hoc, being fixed on some 'historical' basis. The conceptual basis for the PDS is the notion of providing some quantity of cereals so as to make available at least a part of the minimum calorific requirement. Evaluation of the current policy of allocation on the basis of this notion of subsidising real consumption through PDS. **919**

Time to Reconsider

India's political class, taking its lead from Jawaharlal Nehru, has from the beginning maintained that the border dispute and war with China was the result of China's expansionism culminating in a 'massive aggression' which took India by surprise. Chinese account is contrary, charging India with intransigence and aggression and presenting its own military action as reactive and pre-emptive. It is timely to reconsider, with the added perspective of 40 years and in the light of new material, the causes in the policies of two governments which led to the border dispute and war. **905**

Religion and Politics: India and the West

Much of the Indian debate on secularism is built around what seem to be common sense assumptions about India and the west. But a closer look at the impact of Protestant Puritanism on the relationship between religion and politics in the US suggests that these assumptions are mistaken. Far from having fundamentally different experiences, there are some striking similarities between India and the US – similarities which draw attention to potential long-term dangers for India. **887**

Lost Opportunity

The National Adult Education Programme and the Total Literacy Campaign failed to live up to their initial promise. Corruption undermined the former and a quick-fix approach the latter. Further, dependence on the commitment of individual administrators rather than on system reform injured both. One upshot has been that an opportunity for the empowerment of women that unexpectedly presented itself has been squandered. **877**

Chipko at 25

On the 25th anniversary of the Chipco movement, a tribute to the courageous activists who brought Chipco from a possible instrument of struggle to a trend-setting achievement. Also an examination of media-created 'messages' to dispel some of the myths about the movement, in particular whether Chipco was about economics or deep ecology and whether it was feminist. **880**

Decisive Measures

The experiences of 1998-99 show that in a fragile, structurally deficient environment, decisive steps to modulate market expectations alone can restore a semblance of discipline and stability in the financial sector. **868**

Credit Policy

Given the output, price and monetary trends, the credit policy to be announced later this month has to be decisively expansionary. Further, the issue is no longer that of the cost of credit, but of availability of credit and its distribution. **875**

State and Economy in Mexico

The restructuring of the Mexican economy and the reorganisation of the state have changed the government's relation to the people, redefining responsibilities for creating opportunities and resolving social problems. Review of the impact of structural changes on the well-being of principal social groups and the government's response to the profound problems of the neo-liberalism. **883**

Urdu Language and Education

I READ with interest Ralph Russell's observations on the present scenario of Urdu language and education. His wise and apt suggestions regarding promotion of this neglected language, which is also a symbol of the diverse cultural entity of India, are well thought out and reflect an insider's view, although Russell is an outsider, both technically and physically. His concern for the problems of Urdu is laudable and compels us too to take up this issue seriously.

It is a fact that the institutions and academies that were established by the government to further and promote Urdu language (and that too because Urud was not accorded the status of a regional language in the Urdu heartland when the reorganisation of states took place on linguistic basis in 1956) have turned out to be organs of the government always harping on the policies of the government. It is unfortunate that most Urdu writers – without discrimination, prominent and obscure – seek association with these government or semi-government institutions to be a part of the power structure. The manipulating *Urduwallahs* indulge in bullying and goading fellow *Urduwallahs*, but hardly speak against any government policy that intentionally or unintentionally is doing harm to this language. Similarly, there is hardly a magazine or journal in Urdu which calls a spade a spade, though there are Urdu newspapers whose main purpose is to blackmail the government of the day by threatening to turn Muslims against it.

Russell has drawn our attention to a very important aspect which we need to promote and propagate – i e, voluntary organisations should come forward and take up the role of providing facilities for Urud-learning in order to preserve and spread Urdu culture Despite his best intentions to present a feasible way to solve the question of preservation of a language by denying or ignoring the role of state, Russell himself has become instrumental in the hands of the pro-establishment Urud mafia. For example, the information about Anjuman-e Taraqqi-e Urdu (a pro-establishment organisation from the day of its inception during the British period) was provided to him by the former chancellor of Jamia Millia Islamia who had been a king's man loyally committed to the government Being a faithful civil servant who had been union home secretary and governor of several states during Indira Gandhi's reign, he can be the best spokesman of the government. There is reason to believe that he has deliberately misinformed or withheld information about Anjuman-e Taraqqi-e Urdu by saying that this organisation receives little grant from the government. Russell should reckon with the fact that the multi-storeyed building of Anjuman namely 'Urdu Ghar' was bestowed by the government in the prime locality of New Delhi and the huge rent that 'Urdu Ghar' receives from various tenants is enough to run the institution smoothly. It will not be inappropriate to point out that there exists no spirit of public accountability in respect of management and expenditure of funds of this institution. In return for this benevolence showered by the Congress government the Anjuman was obliged to accommodate many prominent *Urduwallahs* loyal to the Congress Party who, in return to this favour, chose to elect only Congressmen as members, thus having monopolised Anjuman.

At another place Russell has failed to judge correctly another civil servant, S R Faruqi's statements because he is unaware of Faruqi's background as an ardent supporter of Indira Gandhi's notorious emergency rule. During the emergency, for his proximity to Sanjay Gandhi, he formed a National Writers' Forum and toured throughout India campaigning among Muslims for support for the emergency. He appealed to Urdu writers to join the forum and not to be *persona non grata* so as to avoid being put behind the bars. The interview given by S R Faruqi and quoted by Russell in his article was conducted after his retirement from the government and thus his pronouncements against government policies indicate his hypocrisy. How can he be relied upon? Furthermore, his elitism and anti-dalit stand is reflected by his declining the offer of the BSP government to become chairman of the UP Urdu Academy, while in the past he had been accepting such honorary posts offered by various Congress governments.

Really it is unfortunate that most Urdu writers tend to be pro-establishment seeking various benefits. To put it on record I would like to cite the example of Ali Sardar Jafri, the standard-bearer of the Progressive Writers' Association who recently has also received the Jnanpith Award. He was perhaps the only prominent writer in any vernacular language who had written a poem entitled *Harf-e Haq* ('A Word in Favour of Justice') praising the infamous rule of emergency and Sanjay Gandhi.

Yet another place where Russell has been deceived by his lack of adequate knowledge of the background is where he mentions the Gujral Commission. Now it is useless to talk about the Gujral Commission and its famous recommendations in favour of Urdu because it is as clear as broad daylight that they were never meant to be implemented – but only to fool Urdu-speaking people. By recommending for Urdu everything between heaven and earth, Gujral became the apple of the eyes of Muslims and it was the immense popularity thus gained that helped his ascendance to the prime ministership. As PM he never gave any thought to implementing his own recommendations. Only when he was dethroned with the UF government losing its majority in the house did he aspire to become PM again by playing the Gujral Commission card. But to his bad luck, by the time Muslims had lost faith in him. I was surprised to see this historic joke finding space in *EPW*

ALI IMRAN ZAIDI

Dodhpur, Aligarh

Exports without Export Promotion

THE latest amendment to the exim policy does make a contribution to improving the health of the economy, in spite rather than because of its policy instruments. As a hangover from dirigisme, Indian policy-makers continue to view exim policies primarily as means of promoting exports and earning/conserving foreign exchange. It is completely alien to the thought processes of the babus to see trade policy as a major determinant of allocative efficiency, the pace of economic growth and the ability of the growth that takes place to create jobs. Commerce minister Ramakrishna Hegde has cast his second exim policy in no different mould.

His most notable proposal is to remove quantitative import restrictions on 894 items and reduce such restrictions on another 414 items, even if it has been presented in a defensive fashion, as one that will not boost the import bill. This dismantling of quantitative restrictions leaves, according to the government, the surprisingly small number of 667 items on the negative list of imports. Another major proposal is to convert all Export Processing Zones into Free Trade Zones with effect from July 1. This has been hailed by industry, as if a few enclaves of freedom from the government would compensate for the irrationality of policy in general. Since all the trade unions have already, and rightly, raised objections to the proposal to free the Free Trade Zones from the regimen of labour legislation in the country, this is likely to join the list of proposals that are disposed of rather than realised. Another initiative that has been received well is to take special note of export of services, and encourage them by specifying the level of export performance that fetches recognition as an export house and accompanying concessions at one-third the level required for merchandise exports.

Other measures comprise rationalisation of procedure – exporters can avail of advance licence for a whole year, instead of supplicating before the DGFT every time they need to import something, an ombudsman at ports to sort out disputes with customs – and enhancement of concessions available to exporters – green cards, golden status for those who export designated volumes for designated periods, liberalised export promotion capital goods (EPCG) and Duty Entitlement Passbook (DEPB) schemes, sector-specific concessions for thrust areas like gems and jewellery, toys, drugs and textiles, harmonisation of the NFEP norms for EOUs and EPZs, liberalisation of value addition norms for export to Russia and administrative enhancement of the special import licence (SIL) premium.

The variety of schemes with their own rules, procedures, certificates of compliance and resultant benefits make for a veritable maze. To make one's way through this maze, it does not suffice that one excels in production and marketing. The chief quality called for is an ability to command mastery over rules and procedures or, more simply, over the goodwill of the babus who administer these schemes. The problem is not just that this raises the transaction costs of earning foreign exchange; rather, the problem is that such a regime converts exports into another source of corruption and degradation of society. It is more profitable to milk the schemes meant for export promotion than to export. It is not surprising that reports keep surfacing of export consignments lying unopened in Dubai godowns for years even as the exporter has not only brought home the payment for such exports but also claimed all the concessions for which the exports make him eligible. Money that had left our borders through illegal channels re-enters the country as legitimate, indeed honourable, tax-free export earnings that fetch additional subsidies. All that is required to be done is to package some junk as export consignments, bribe these over-invoiced exports' way past official inspectors and arrange for the service of remitting the hard currency payment.

Why is the country saddled with such a bizarre, costly way of earning foreign exchange? The explanation has to be traced to the original sin called export pessimism. India's policy-makers took it for granted that a developing country like India could not effectively be part of an international division of labour. This meant that the country had to try and produce on its own everything that it required and conserve foreign exchange at any cost. To encourage import substitution, the government offered domestic producers high levels of protection. To avoid 'wastage' of resources through 'unhealthy' competition, the government also instituted licensing of production. Protection from international competition and abortion of domestic competition have ensured that the country could earn foreign exchange through either aid or special inducements to those producers who condescend to export. When domestic prices are higher than global prices, a producer has no incentive to try and sell abroad. Further, since his input costs (save that of labour) are also higher than abroad, he is not cost-competitive in global markets. Further, the absence of competition from within or without has reduced his product quality to a level that is unacceptable anywhere else. The only way he can sell his goods abroad is to flog them at a huge discount to the domestic price. This he would, only if the government was prepared to compensate him for that discount through a variety of incentives. Thus incentives to promote exports is an integral part of high-cost import substitution. The self-defeating nature of such incentives manifests itself in many ways, including the alienation of state

governments from export promotion, as many incentives, like pre-emption of sales tax on goods going into export production, are at the expense of the states.

Hegde's exim policy sees that certain policies such as inflexible labour practices, small-scale reservations and restrictions on export of agricultural products constrain exports. But it falls far short of appreciating the basic problem with the country's strategy for exports. Therefore, its contribution to genuine restructuring of the economy to a situation where exports will take place on the merit of Indian producers' competitive strength is all the more remarkable. This contribution is the removal of quantitative restrictions at a faster pace than India had committed itself to within the framework of the World Trade Organisation. Which is just as well. A WTO dispute settlement panel has ruled, after the exim policy was announced, that India cannot justify any quantitative restrictions on imports on balance of payments grounds. The panel, however, concedes that India will need to phase out QR removals and has recommended that India negotiate the transition phase with the US, the country that had filed the dispute. The present aggressive move on QRs will give India some leeway in negotiations with the US, apart from opening up the economy to greater international competition. The fact that QRs have been lifted on the import of many items that are reserved for the small sector within the country will pave the way for faster removal of such irrational reservations – after all, it makes no sense to keep Indian industry out of segments of the Indian market that are accessible to foreign producers.

The latest exim policy is thus likely to do more for export promotion than its predecessors, even if not quite in the manner intended by its authors.

UTTAR PRADESH

Caste Tussle in BJP

HAVING managed to confine his political rivals in the state, Mulayam Singh Yadav and Mayawati, to their respective groves, Kalyan Singh, the BJP chief minister of UP has been facing more frequent trouble from his own party MLAs of late. The dissent within the party is taking the appearance of a clash of interests between the forward and the backward castes. But actually Kalyan Singh, who happens to be the party's only mascot from the numerously large backward castes, has been steadily expanding his influence with the help of his control over the government machinery, thus edging out his competitors within the party, who incidentally happen to be from the upper castes, the traditional base of the BJP.

Former state party president Kalraj Mishra, minister for urban development Lalji Tandon and present state president Rajnath Singh are all wary of Kalyan Singh's consolidation, lest it lead to the shrinkage of their own patronage. They are the ones who have an active interest in stoking uncertainty for Kalyan Singh. The frequent delegations of disgruntled legislators visiting the party's headquarters in Delhi, the rounds of signature campaigns seeking Kalyan Singh's removal from chief ministership, and the recent resignation of the minister for family and child welfare, Devendra Singh Bhole, on the eve of the party's national executive meeting in Goa, cannot but be interpreted as attempts by an increasingly impatient lobby of upper caste leaders within the party to pressurise the central leadership to rein in Kalyan Singh. Even the sympathies of the larger sangh parivar were solicited in order to corner the chief minister when he axed education minister Ravindra Shukla for bungling the Saraswati Vandana issue. Sensing the uncertainty of the BJP-led coalition at the centre and its need for new allies to stay afloat, the upper caste lobby in the state is manoeuvring to rope in the Bahujan Samaj Party in its toppling game. Yet, knowing well his strategic importance in getting the intensely contested backward caste votes for his party, Kalyan Singh seems confident that despite the propaganda against him, the party high command dare not encourage such dissidence, all the more so given the trying circumstances in which it finds itself at the centre.

The attempt to make out a case that Kalyan Singh is working against upper caste, especially brahmin, interests is not going to work, for Kalyan Singh is also nurturing brahmins under his wings. When Rajendra Tiwari was removed from the Lucknow district presidentship at the behest of state party president Rajnath Singh, Kalyan Singh had him appointed as the chairman of the essential commodities and food corporation. Similarly, Ram Kumar Shukla, who nursed a grievance for having been denied a ticket in the last assembly election by Lalji Tandon, was made chairman of the state consumer cooperative federation. Recently, when Bhole resigned as minister for family and child welfare in an attempt to turn the heat on Kalyan Singh, the latter replied by elevating Kusum Rai, one of his loyalists, to the post of chairperson of the state social welfare board.

Kalyan Singh on his part has not been lacking in efforts to cut his opponents to size. He has shown alacrity in filing FIRs against three party MLAs in the forefront of the campaign demanding his ouster. He has been equally prompt in shielding Aditya Nath, a party MP, who has been accused in the Maharajganj distric magistrate's report as well as in the FII filed by the police of instructing to fir at a Samajwadi Party meeting leading t the death of one head constable. His wel publicised drive against the criminal mafi in the state notwithstanding, Kalyan Singl is certainly not above protecting crimina elements within his party owing allegianc to him, as is evident from the extensio of additional security to the accused, on of Kalyan Singh's close aides, in th Brahma Dutt Tiwari's murder case. Th result is the further entrenchment o gangsterism in politics in a state that ha witnessed a steady spurt in crime in recen years.

CHILD TRAFFICKING

Easy Options

IT is useful that in the child traffickin scandal in Andhra Pradesh, there are easil identifiable villains in the shape of th heads of the organisations which trade in children. These persons bought an sold children and made profits. This i easy to condemn. What is much mor difficult to face is the culpability of par ents who sold their children. True th parents are poor, mind-numbingly poo and with little hope of betterment. But child's rights must be acknowledged an protected above all other considerations This must be borne in mind because according to the police, their main aim i to restore the children to their parents

But then where will the children go i not to their parents? The state is unable nay unfit, to take care of the children. Thi was demonstrated in the case of the chil dren recovered from the adoption centres

When the police walked in to bust thi racket, their reputation preceded them and the staff who had looked after th children ran away. These were employee and perhaps did not have as much to fea in a court case. But courts are far away, th police are close. It made sense to run. Th absence of the adoption centre staff mad the situation of the 'freed' children worse

The child and welfare departmen chipped in with its bit. It failed to delive provisions for the children after the adop tion centres ran out of basic necessities If it is procedures that held them up, wi these procedures be changed? If it wa dereliction of duty, will the officials re sponsible be punished? And why is ther not an emergency arrangement which ca cut through the red tape?

Chief minister Chandra Babu Naid 'helped' the children by publicly admon ishing the doctors at the Niloufer Hospital and the doctors went on a token strike protest. Naidu calculated right – it is mor popular to sympathise with a mothe

sobbing with her dead baby in her arms than to try to understand the doctors' problems. The doctors are educated, well-off and perhaps do not vote at all.

There is almost no information on the people who bought the children except that they are foreigners willing to pay Rs 1 lakh or more for a child. Do their home countries investigate the manner in which these children are adopted? Is legal action possible against these buyers in their own countries? The US customs team visiting India to find out if 'indenture' child labour exists in India will be better employed investigating the purchasers of third world children in its own country.

CRIME

The Unemployment Link

WHILE grieving over the tragic death of five unemployed youth in Mumbai, there is a genuine apprehension that the main issues behind the ghastly tragedy will be conveniently glossed over or may not even be touched upon. It seems that for some time now, a local thug in Mulund, a suburb of Mumbai, who also doubles as a political activist of a national party, was involved in a court case against one of his tenants. Tiring of the legal processes or perhaps apprehending an adverse outcome of the case, he decided to substitute muscle power for the legal procedures.

He went around and recruited over 50 unemployed youth from a hutment colony, promising them jobs as watchmen or as security guards on a handsome pay. He gathered them together in the early hours one day, got them to break open the locks on the shop of his contentious tenant and had started carting out the goods therein, confident perhaps that with his political clout, he would get away with taking the law into his own hands. But somehow things did not quite work out as per expectations. The police reached the spot after a while. In the melee that followed, the 'security men' recruited by the politician ran helter-skelter and some of them fell into a nearby well. Five of them could not swim and drowned. All the five around 19-20, moderately educated and unemployed.

The fact that all the young men were from a dalit community is not as significant as the fact that all were unemployed and desperately in search of jobs. It is a telling commentary on the job situation in the city and the country that one neighbourhood in one suburb of Mumbai can throw up literally hundreds of jobless youth desperate for a job, any kind of job, even one involving breaking into a shop in the early hours of the day, when hired to do so by a local political heavy. Yet, in the aftermath of the tragic event, the fact that a criminal act was being perpetrated with impunity by someone supposedly with political connections does not seem to have received as much attention as the caste of the victims. The fact that not only the person concerned but many others of the neighbourhood expected him to pull off the deed without a hitch, going to the extent of helping him in it, is a sad commentary on the state of law and order in the city.

Even though the police were on the spot at the time of the crime, they were unable to apprehend the main suspect. In fact, even after two days, the whereabouts of the person were unknown to the police. It has to be faced that, of late, the record of Mumbai police while tracking persons with political connections has not been the best. Not too long ago, they were unable to locate an MLA who was suspected of perpetrating a fraud on the co-operative bank he headed; similarly an academic who is politically active and who was accused of molesting a student, was also untraceable for some days. In both cases, the police could find out their whereabouts, by a strange coincidence, only after their applications for anticipatory bail could be moved in the court of law. What is noteworthy is that this inability of the police seems to be unaffected by the political colours of either the government in power or of the suspect.

Much is made of young men being easily attracted to a life of crime. With the legitimate job market not able to absorb even a fraction of the job-seekers entering the market, a jobless youth, his respect for law deadened by what he sees around him every day, cannot be entirely blamed if he is ready to explore any avenue to make a living.

While all this may be stating the obvious, the effort may not be entirely worthless when one sees the caste factor being played up in most of the reports of the tragic episode and in the reactions of politicians. Of course, in the prevalent political climate, any serious action on the main issues is unlikely. More likely, the tragedy will be looked upon as yet another atrocity against the dalits and after a while quietly shelved.

WAR AGAINST YUGOSLAVIA

The Economic Factor

A correspondent writes:

THERE is no theory of war which ignores the economic factors that ultimately lead nations to engage in war. One does not have to be a votary of the view that economic factors alone lead to wars to recognise the significant role that economic factors play even though the immediate causes may be non-economic.

The famous British economist John Maynard Keynes recognised the importance of economic factors behind wars. That is why in his solution for capitalism to survive when aggregate demand tended to get depressed, he spoke of digging holes in filling them, rather than resorting to war as a means of boosting aggregate demand. Right now there is high unemployment in practically all the EU countries. The overall average unemployment rate is over 10 per cent, and in countries like Spain it is over 20 per cent. Still if from time to time nations prepare for and resort to war, the huge cost involved notwithstanding, it testifies to the influence of the military-industrial complex in capitalist societies.

It is under the pressure of the military-industrial complexes in these countries that in spite of the end of the cold since 1989, there is no let up in the military budgets of the US and other NATO countries. That is why many people who expected that with the end of the cold war there would be enormous savings in the military budgets of the countries engaged in the cold war and that these savings will be diverted to the development of countries and sections of the people left behind in the race for economic prosperity feel betrayed. New grounds were found by the developed countries to continue having sizeable military budgets in spite of the end of the cold war. It is this sort of thinking that lies behind the continuing military build-up in the NATO countries.

It is also the same sort of reasoning that is behind the military actions taken under US leadership in different parts of the world. The military action against Yugoslavia is the latest in that series. It is possible that after the military action against Iraq, which in a sense is still not over, the military action against Yugoslavia may well turn out to be the most expensive. Going by the enormous size of the air- and sea-borne armada assembled for operations against Yugoslavia, there can be little doubt that when the costs of this operation are put together, they will add up to an enormous amount.

Of course, when one speaks of the cost of wars, one must take into account the destruction of lives and material that military action causes. Right now every morning one wakes up to hear of the destruction of infrastructure, including power plants, bridges and buildings in addition to the displacement of thousands of the civilian population. Ultimately the length of the war will be determined by the stamina of the warring parties. But the real winners will be the military-industrial complex, because for them the greater the destruction the larger will be the demands on them in the post-war era.

The developed market economies have continued to dominate world exports with a share of around 70 per cent in the 1990s with intra-trade amongst them being about 72 per cent of their total exports. However, this latter share has come down from a high of 77.5 per cent in 1990 while their exports to developing countries have increased to 24.2 per cent in 1995 from 19 6 per cent in 1990. Looking at developing Asia (excluding west Asia), the formation of different trade groups has led to 38.7 per cent of their exports going to their own economies in 1995 as compared with 24 per cent in 1980; this increase has been at the cost of Europe.

NAGARJUNA FERTILISERS

Lower Production

THE Hyderabad-based Nagarjuna Fertilisers once again witnessed a drop in its profitability in 1997-98. After its net profit dropped significantly in 1996-97, the company seems to have been unable to change the trend. In fact, while net sales had improved in the previous year, it actually dropped by 13.7 per cent in 1997-98. It was all downhill from there. While operating profit declined by 30.3 per cent over the same period, net profit was lower by 24.3 per cent. This despite a drastic fall in depreciation (down 92.2 per cent) and tax provision (down 63.7 per cent). Though earnings per share declined from Rs 4.9 to Rs 3.7, the company maintained the dividend rate at 18 per cent.

The company attributes the fall in its turnover to lower production during the year. With the restrictions of the government on the offtake of urea to be limited to 115 per cent of capacity, the company's urea production dropped from 7.17 lakh tonnes in the previous year to 6.89 tonnes in 1996-97, representing a drop of 4 per cent.

Meanwhile the company's expansion project for doubling its fertiliser manufacturing facilities at Kakinada (Andhra Pradesh) was completed during the year within the estimated cost and began commercial production on March 19, 1998.

The company issued 6,95,00,000 warrants to the promoters on preferential basis during the year. It claims that this was done to ensure stability and continued direction to the company. The promoters will be entitled to convert each warrant of Rs 15.71 into one equity share of Rs 10 within 18 months from the date of allotment of the warrants. The move will increase the promoters' stake from around 29 per cent to 42 per cent of the enhanced capital.

The company has now embarked on a diversification project in order to take advantage of synergy of operations. It is setting up a world class refinery conforming to international standards at Cuddalore in Tamil Nadu through Pennar Refineries, along with the Tamil Nadu Industrial Development Corporation. The project is estimated to cost approximately Rs 3,200 crore and is being set up with financial assistance from domestic and overseas financial institutions and banks. In addition to this, Nagarjuna Fertilisers is also undertaking the implementation of a 1,000 MW power plant at Mangalore.

Meanwhile, the company's performance seems to have improved in 1998-99. For the first three quarters of the year the company has notched up an impressive 34 per cent increase in net sales over the corresponding period of the previous year. Though interest (up 67 per cent) and depreciation (up 88 per cent) increased significantly, the company managed to improve its bottomline by 24 per cent over the same period from Rs 98.95 crore to Rs 122.8 crore. The warrants issued to the promoters earlier were converted into 50,75,000 equity shares of Rs 10 each at a premium of Rs 5.71 per share in December 1998.

The company's stock presently quotes at around Rs 15 on the bourses, discounting its 1997-98 earnings by a mere 4.1 times.

GODFREY PHILLIPS INDIA

Steady Growth

Cigarette major Godfrey Phillips India is a part of the K K Modi group of companies while Phillips Morris of the US holds a 36 per cent stake in the company. Godfrey Phillips is known for brands such as Four Square and Red & White in the premium segments and Cavenders in the popular lower segment. The company draws up to 90 per cent of its turnover from cigarettes and the balance from tobacco and tea. Its blended tea is sold through the Tea City franchise. In addition the company also has a minor presence in real estate. In the cigarettes segment, however, the company is next only to ITC, and commands a market share of 15-17 per cent.

The company has witnessed a steady growth over the years. For the year 1997-98, the company notched up a 14.3 per cent increase in net sales. Operating profit improved by 22.5 per cent and with interest costs falling by 33.6 per cent, the company managed to post a 70.7 per cent increase in its bottomline during the year under review. With earnings per share improving from Rs 21.9 to Rs 37.4, the company decided to raise the dividend rate from 70 per cent to 100 per cent. Book value, meanwhile improved from Rs 96.6 per share to Rs 122.9 per share. The company share price currently rules around Rs 768 on the bourses, discounting its 1997-98 earnings by a comfortable 20.6 times.

Sale of cigarettes by the company, in volume terms, rose from 12,962 million during the previous year to 13,100 million in 1997-98, which is an increase of 1 per cent. In value terms, however, the rise was much higher at 15 per cent.

The cigarette industry is fragmented in line with the excise structure. The premium segment comprises king-sized and premium brand cigarettes while the popular segment comprises smaller sized cigarettes. The popular varieties account for over 85 per cent of total sales.

GOODLASS NEROLAC PAINTS

Good Performance

The second largest paints company in the country, Goodlass Nerolac Paints performed well in 1997-98. While net sales increased by 7.3 per cent over the previous year, operating profit improved by 7.6 per cent. A fall in interest (down 1.5 per cent) depreciation (down 14 per cent) and tax

company post a higher bottomline too. Consequently, net profit was higher by 28.7 per cent and earnings per share rose from Rs 17.9 to Rs 20.4 over the same period.

Encouraged by its performance, the company raised the dividend rate from 60 per cent last year to 65 per cent. Book value, meanwhile, increased from Rs 83.9 per share to Rs 95.9 per share. The company's equity share presently quotes at around Rs 147 on the bourses, discounting its 1997-98 earnings by 7.2 times.

The company is the market leader in industrial paints, which is the fastest growing segment within the industry. The paints industry itself is divided into two segments, namely, industrial and decorative. While the decorative segment accounts for 70 per cent of the market, industrial paints account for the balance 30 per cent. This ratio is expected to balance out to 50:50 in the next 5-10 years.

Despite the higher profitability, one area where the company has not performed well is organic and inorganic pigments. The company had set up a capacity to manufacture 1,680 tonnes of inorganic pigments and 350 tonnes of organic pigments, which are inputs in the manufacture of paints. The company's realisation from inorganic pigments fell by 14.6 per cent while that from organic pigments declined by 4 per cent in 1997-98. Moreover, captive consumption just accounted for 41 per cent of inorganic pigment production and 18 per cent of organic pigment production. In a strategic decision, the company has now decided to shut down the organic and inorganic pigment unit and sell off the real estate. The plant is built on 27 acres of land and the proceeds could be used to meet working capital requirements or retire some of its debt.

The company joined the other big paint majors in the instant shades market following the launch of Nerolac Colour Scape, an integrated colour matching system designed to be a one-stop colour shop. Ever since Jenson & Nicholson's Instacolor in late 1996 and Berger Paints' Colour Bank, tinting machines have become the marketing device for all paint majors. Colour Scape will cost the dealer Rs 5.9 lakh, compared with Asian Paints' Colour World which costs 6.5 lakh and Jenson & Nicholson's Instacolor which costs Rs 8 lakh.

Meanwhile, the company's new manufacturing unit at Lote Parshuram in Maharashtra, for the manufacture of paints, varnishes and enamels, commenced commercial production on April 29, 1998.

Debt Defaulters as Darlings of Society

D N Ghosh

The debtor-creditor relationship is becoming increasingly complex and the promise to pay is fast losing its sanctity.

A UNIQUE experiment in prison reform: Dubai has, it appears, decided to establish a state-of-the-art business centre for prisoners who had once shot into limelight as market savvy financial engineers but defaulted on their debt obligations. These jailed geniuses will be encouraged to run legal businesses from within prison walls; their creativity will not go rusty. Think of the beneficial fallout of this decision: why would then an evil genius take the risk of a death sentence for a few ounces of heroin when he can probably earn millions in the sanctuary of the jail premises?

What a contrast to our conventional thinking on debt distress and imprisonment! No religion has ever taken kindly to usury or to the temptation to borrow. For centuries societies have required debtors to honour their obligation or face imprisonment and accept life-long obligation to repay. Charles Dickens weaves a poignant story in Little Dorrit on Marshalsea, the debtors' prison in Southwalk. Most of the prisons were like dungeons; even the Fleet Street prison, which was meant for debtors relatively more respectable in the social ladder, was called the grave of the living. Till the 17th century it was not uncommon to inflict barbaric punishment on debtors for fraudulent concealment or embezzlement: to use the words of Sir William Blackstone, "unless it appeared that the inability of the bankrupt to pay his debts arose from some casual loss, he might upon conviction by indictment of such gross misconduct and negligence, be set upon the pillory for two hours, and have one of his ears nailed to the same and cut off".

From about the late 18th and the begining of the 19th century, social reformers had been agitating on humanitarian considerations for relieving distress of debtors; progressively the polity moved away from a system that locked up debtors and the bankrupt unless they paid every penny. The relief from draconian punishment helped encourage persons to borrow financial resources to exploit the new emerging opportunities in the industrial revolution era and help foster entrepreneurial and creative activities. *The Times* noted in its editorial on July 19, 1844 that the country was now set to progress from the age of barbarity to one of civilisation.*

While supporting the prison reform movement, John Stuart Mill, while supporting the reform, expressed concern that in going into a violent reaction against the ancient severity, the reform measures might generate in debtors "a peculiar title to indulgence" in losing or squandering other people's property. To quote Mill, "The indulgence of laws to those who have made themselves unable to pay their just debts is usually defended on the plea that the sole object of the insolvency law could be to get at his property and distribute it fairly among his creditors. ...It is the business of law to prevent wrongdoing and not simply to patch up the consequence when it has been committed; to take care that insolvency should not be a good pecuniary speculation; *that men should not have the privilege of hazarding other peoples' property without their knowledge or consent, taking the profits of the enterprise if successful and throwing the loss on the rightful owners if it fails*" (emphasis added).

Mill's observations are something to ponder over, particularly by those concerned with the health of our financial system. For centuries the debtor-creditor relationship had been based on the unquestioned acceptance of a promise to pay underlying the bill of exchange: Regarded as one of the most fundamental innovations in the evolution of the financial system, it has been the universally accepted procedure for settlement for trade and other transactions across different countries and trading centres. Debt has an embedded option, you can choose not to repay. That right of choice is inherent in a market economy, but those who exercise that choice must be made to pay for the consequences of that choice. Limited liability and permissive bankruptcy laws have led to a spurt of so-called innovative activities where borrower-creditor relationships get rewritten all the time in a complex set of legal and technical fine print. The creation of a legal facade as a protective shield has become an obsessive game by itself. In the mountains of debt that are being piled up, the issuers, investors and underwriters have to talk, write, and document in the finest of fine print, the rights of creditors and the obligations of debtors. The newly emerging tribe of financial engineers-cum-legal luminaries, functioning as advisors to debtors, know all the tricks of the trade to teach them how to walk away from the repayment obligation. The battle of wits between the debtors and creditors start from the beginning itself; debtors always on the look out for safe and honourable escape routes and in the end, when the chips are down, the enforcement of obligations becomes a nightmarish experience.

What is happening all around us is a matter of grave concern. The debtor-creditor relationship is becoming increasingly complex and intricate and in the evolving pattern the principle of promise to pay is fast losing its pristine sanctity. One learns all too soon not to bat an eyelid in deciding to walk from any repayment obligation. Owning large sums of money and not caring a damn is the accepted way of making sure that the person is one of the top people in the social hierarchy. They are always ready with frivolous reasons for non-payment of dues, like Algernon in Oscar Wilde's play *The Importance of Being Earnest*, "Pay it? How on earth am I going to do that? No gentleman ever has any money." The nonchalance of debtors is becoming legendary. It is prevalent in virtually every sector of our society. The vast majority of our people do not feel responsible to pay their dues. They expect the state to provide all kinds of services and believe that it is their birthright to have free access to these facilities.

Debtors are emerging as the darlings of the economy. There is no place for debtors with weak hearts, those who ruminate on possible social stigma and its consequences; the new world that is emerging

* Hugh Barty-King, *The Worst Poverty: A History of Debt and Debtors*, Sutton Publishing, 1991.

belongs to the daring, the more massive their indebtedness, the more honourable they are in the pecking order. Debtors and financial engineers have emerged as congenial partners. Nothing happens to those who play about with astronomically high debt funds and create havoc for the system. Wiser after the event, the actors and law-makers become engrossed in learned discussions on information flows and their asymmetries, regulatory slippages, disclosure standards, transparency and all that but what recedes into the background is the stark fact that those who were primarily responsible for taking risks and playing with high stakes, those who knew the consequences of their actions when the bubble was pricked, escape unhurt except for some passing inconvenience or unpalatable press comments. They shrug it off as a bad dream and bide their time to regroup themselves for launching, with more vigour than ever before, on another bout of innovative frenzy.

We all know too well that debtors have emerged as one of the most powerful interest groups in our society. Their connections with the political class are their most precious asset. Look at the way we talk and deal with the debtors to the banking system. The expression non-performing assets, for example, takes out the sting, shifting the focus of accountability on to the creditors. With schemes of restructuring, rescheduling, reclassification and the whole array of innovative products coming under the umbrella of securitised assets, the drama of covering up debt defaults goes on all the time, all across the financial system. While upgrading the quality of balance-sheets, it also simultaneously upgrades the respectability status of individual debtors or corporates and covers up their deception games.

The integrity of credit is the key to the smooth functioning of the economy and economic actors have to accept, as a trade-off for freedom and flexibility, a commitment to preserve it. They have to act responsibly and they can be made to do so if the political class behaves responsibly. Our polity has to continually devise mechanisms to ensure that the price for misusing credit raised from the resources of the society is made prohibitively high and the punishment meted out is exemplary. The rules in the battle of wits are changing fast and our investigation and enforcement agencies have to match the skills and agility of the new emerging breed of reckless financial engineers. Our polity must be willing and committed to address itself to this task, but clearly, as we look around us, this ranks low in our scheme of reform priorities. The recent debate and discussion on the nature of punishment for offences on money laundering is an eye-opener. Smitten perhaps by a bout of political humanitarianism the political class has opted for relaxation of the investigation and enforcement mechanism. It would surprise none if they shed tears for those unfortunate enough to be caught in the net and opt to emulate the Dubai example of a protective and comfortable sanctuary for debt defaulters and scamsters. Take hint, financial engineers, be bold and put prison reform at the top of your economic reform agenda.

Decisive Measures Ensure Stability

In a fragile, structurally deficient environment, decisive steps taken to modulate market expectations alone can restore a semblance of discipline and stability in the financial sector.

I
1998-99: A Unique Experience

THE financial year 1998-99 has ended with some unique features in the money market experience, which have helped to negate the worst market fears nursed in the early part of the year. What has made this possible in itself provides an illuminating lesson, which is that in a fragile, structurally deficient environment, decisive steps taken to modulate market expectations alone can restore a semblance of discipline and stability in the financial sector. In earlier years, whether in regard to yield rates on sovereign papers, or on call money rates, or on the rupee's exhange rate determination, the policy signals were those of a free play for the market forces which had, very often with the slightest of provocations, resulted in dramatic disturbances and gyrations in rates of interest or in exchange rate of the rupee. During the past year or so the RBI has sent out firm signals of its readiness to take decisive steps to curb speculation and arbitration between markets and has in fact administered doses of such steps, the benefits of which have been reflected in the orderly conditions that have prevailed in the financial markets during the past year or so.

Amongst the distinguishing features of the money market trends in 1998-99, there was the unprecedented gross market borrowing by the central government of Rs 93,953 crore or net borrowing of Rs 62,903 crore. This was accomplished along with significant reductions in coupon rates and elongation of maturity periods of securities. The instrument of success was the RBI's willingness to accept initial devolvement or even private placement of government paper with the objective of their orderly release to the market from time to time. Thus the RBI took on Rs 38,205 crore (or 45.6 per cent) out of Rs 83,753 crore of the gross long- and medium-term borrowings; of the amount so subscribed by the RBI as much as Rs 26,384 crore (or 69 per cent) have already been sold to the market through open market operations (OMOs).

It may be argued that such an achievement was made possible because of the excess liquidity available in the system, but this was only partly true. First, in the past even when liquidity was excessive, market expectations were stimulated by the RBI's policy stance of allowing the free play of market forces and hence the cut-off yield rates were allowed to remain high. Secondly and more significantly, the overall deposit growth of scheduled commercial banks during 1998-99 has not been higher than that in the previous year; it was Rs 1,11,861 crore or 18.5 per cent against Rs 99,811 crore or 19.7 per cent in 1997-98. This was inclusive of Rs 17,945 crore as proceeds of Resurgent India Bonds (RIBs). In fact, excluding those RIB proceeds, deposit growth with banks in 1998-99 were significantly lower both in absolute and relative terms: Rs 93,916 crore or 15.5 per cent against Rs 99,811 crore or 19.7 per cent in the previous year. Banks' total assistance to the commercial sectors remained at Rs 54,318 crore or 15.8 per cent compared with Rs 53,882 crore or 18.6 per cent.

The other noteworthy achievement of 1998-99 have been the tight leash kept on the call money market through the policy of fixed-rate repos and that on arbitration between the money and forex markets including strong measures relating to rebooking of cancelled contracts for non-trade transactions and even trade transactions covering imports.

Other Developments

First, the RBI has kept unchanged the limit for ways and means advances (WMAs) in respect of the central government for the financial year 1999-2000 at the last year's levels of Rs 11,000 crore for the first half (April-September) and Rs 7,000 crore for the second half (October-March) of the year. The government's use of 75 per cent of the limit will trigger a fresh floatation of market loans depending on market conditions. The interest rate on WMAs will be charged at the Bank rate (8 per cent at present) and that on overdraft at the Bank rate plus two percentage points. The government, however, will have to keep a minimum balance with the RBI of not less than Rs 100 crore against the previous Rs 50 crore on Fridays and not less than Rs 10 crore on other days against the earlier Rs 4 crore. The RBI will also not allow, as in the past, overdrafts beyond ten consecutive working days from April 1, 1999.

Second, a technical committee set up to determine prudential guidelines for issue of guarantees by state governments has recommended, among other things, four

parameters for fixing a ceiling on guaranteed amounts. The committee has also recommended that guarantee fees should be charged and that a contingency fund for repayment of guarantees should also be created at the state level. It has suggested that no letters of comfort should be given by states; rather, in such cases, credit enhancements should be given through explicit guarantees. According to the technical committee, full details of all guarantees given by a state should be disclosed in the state budget.

Thirdly, on March 31, the government announced that non-government provident funds, gratuity funds and superannuation funds will now be allowed to invest in [illegible]approved units of gilt funds. This will be within the limit of 25 per cent of their corpus allowed to be invested in government securities. From the balance, non-government PFs are allowed to invest 15 per cent in state government securities, 40 per cent in PSU bonds,

10 per cent in corporate bonds with trustee approval and another 10 per cent in any other paper. The move will give a boost to the gilt funds and will also broadbase the government securities market. Kotak Mahindra Mutual Fund already has a money market mutual fund.

Finally, the special liquidity support to banks that had raised Resurgent India Bonds (RIBs) money against their holdings of government paper at the Bank rate for a limited period between September 1998 and March 1999 has come to an end on April 5. A limit of about Rs 3,235 crore, thus got extinguished, though the amount of utilisation has been unduly meagre (Rs 4.50 crore at the end of February).

II
Call and Forex Market

The overnight call money market experienced some unusual pressure. The fears of yet another tranche of government borrowings coming to the market any time during the month as the WMAs drawn from the RBI were already running above limit, the expected withdrawal of as much as Rs 5,000 crore through advance tax payments and the oil companies doing equity swap deal amongst themselves as part of the government's disinvestment programme, brought about tightness in the money market. On top of these factors

were a very active OMOs' window of the RBI and a spate of holidays throughout the month. The result was that the call rate, which remained firm at above 8 per cent despite the reduction in the fixed repo rate to 6 per cent on March 1, further firmed up towards the third week of the month. The additional liquidity injected through half a percentage point reduction in CRR from March 13 or the substantial liquidity support given to primary dealers did not reduce the call rate. From 8.10-8.50 per cent in the first half of the month, the overnight rates firmed up to 9.50 to 11.50 per cent during the week March 15-19 (Graph A), when banks preferred to avail of substantial export credit refinance. The rates, however, softened in the fourth week when dollar accruals by the RBI increased, injecting more rupees. Banks' borrowings from the RBI dipped from Rs 8,202 crore as of March 19 to Rs 2,894 crore on March 26. Since the second fortnight had a number of holidays, the banks had covered their positions much before the reporting Friday (March 26). The demand being low, the call rates slipped to touch 3 per cent on that day. However, on March 31 the quotations of call rates soared to 16 per cent due to limited supply of funds, as banks were unwilling to lend for year-end considerations. Reuters' MIBOR touched 12.34 per cent and NSE's MIBOR 12.97 per cent. The month of March saw increased volatility in call rates as reflected in coefficient of variation for March working out 16.7 per cent as against 3.8 per cent in February (Tables 2 and 3).

Forex Market

March was yet another month of rupee stability. As the budget did not signal any changes in forex policy, belying expectations, the market response to a drastic reduction in the repo rate was muted and

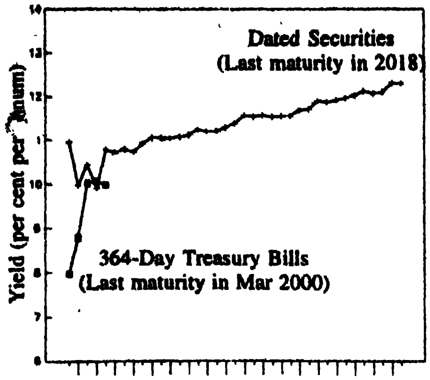
Figures in parentheses in cols 3 to 6 represent numbers and amounts of non-competitive bids which are not included in the total.
Figures in the square brackets under cols 8 and 9 represent weighted average price and respective yield.
* Bracketed figures in col 7, if any, relate to devolvement on primary dealers, exclusive of RBI. – No bid.

Graph B: Yield Curve for Dated Securities: Day of Maximum Transactions (March 23) During the Second Half of March 1999



shortlived. For about a week up to March 8, the rupee fell to Rs.42.52/55 against the earlier Rs.42.42/45 but thereafter recovered and remained at the previous level throughout the month. This has happened despite the US dollar firming up against all major currencies with the euro slipping to a new low below $1.0850. Some foreign banks did resort to arbitraging by borrowing from the call market, but the contrary forces of corporates selling dollars or resorting to major import cancellations, banks unwinding their long positions earlier built up in anticipation of a weak rupee policy, and increased flow of dollars following renewed net investment flows by FIIs, and exporters encashing foreign exchange to boost their balance sheet, all combined to sustain the rupee strong (Graph B).

Between February 26 and April 1, there has been a $1,788 million accrual to reserves. Combined with a tight call money market, these factors kept forward premia under check except for the near first month (Graph C) as a result of the scramble for short-term coverings in the face of some conflicting policy signals on exchange rate management (at one point, the finance minister had shown a preference for a 5 per cent depreciation of the rupee).

III
Primary Market

Gilt-Edged Paper

There was no fresh issue of dated security in the market during March despite the government breaching the WMA limits on several occasions (which are tolerated as overdrafts at 2 per cent penalty rates for 10 days). The rates on treasury bills, however, were reduced after the RBI lowered the Bank rate and the repo rate on March 1. In the auction held on March 5 for 14-day bills, the rate was lowered from 9.39 per cent to 8.35 per cent and further to 7.82 per cent in all the subsequent three auctions (Table 4). Likewise, the rate on 91-day bills was cut from 9.54 per cent to 8.79 per cent and then to 8.75 per cent in the last three auctions and that on 364-day bills from 10.62 per cent to 10.07 per cent during March (Tables 5 and 6). The first fortnight witnessed no devolvement either on RBI or on PDs. Due to squeeze on liquidity, however, the second fortnight saw some devolvements on PDs and RBI. The total amount raised during March through 14-day and 91-day bills was Rs 400 crore each and that through 364-day bills Rs 1,500 crore.

Bonds Market

With the ensuing year-end, the issuers flooded the bond market to complete their fund raising targets. The rate cuts effected by the RBI on March 1 hardly had any impact on the primary bond yields offered.

Figures in the square brackets under cols 8 and 9 represent weighted average price and respective yield.
* Bracketed figures in col 7, if any, relate to devolvement on primary dealers, exclusive of RBI.

As usual, financial institutions, banks and state PSUs dominated the primary market.

The month saw a marked success of state PSUs. Ten such PSUs collected Rs 1,792 crore against the proposed amount of Rs 1,301 crore – an excess of Rs 491 crore. The bulk of Rs 1,500 crore was collected by the Andhra Pradesh Transmission Corporation, the successor entity of recently unbuddled AP State Electricity Board – an overwhelming response for an initial proposed amount of Rs 300 crore.

The Karnataka State Financial Corporation (KSFC) placed its 4-year 13.5 per cent guaranteed bond in the private placement segment to raise Rs 200 crore. The issue carried an assured budgetary support from the government of Karnataka with a letter of comfort specifying tripartite agreement among the state government, KSFC and the trustees of the issue. The issue carrying a YTM of 13.96 per cent has already mopped up Rs 70 crore. Yet another issue of the same state – Karnataka Neeravari Nigam (KNNL) – hit the market to collect Rs 50 crore plus any over-subscription. This 5-year guaranteed bond carrying LA+(so) rating offered 13 per cent rate of interest. Among the higher rate category, there was a 5-year guaranteed bond offering 14.9 per cent annual coupon rate from UP State Yarn Company. It proposes to raise Rs 35 crore but the response is not known. Sardar Sarovar Narmada Nigam (SSNNL) entered the market with two options: (a) 4-year 10-month bond in the nature of promissory notes offering a coupon of 14.5 per cent payable semi-annually; and (b) 15 per cent payable annually. The issue plans to raise Rs 300 crore which includes an unspecified greenshoe option. Hutti Gold Mines Co and Damodar Valley Corporation continued with their issues from the previous month. National Capital Region Planning Board (NCRPB) came out with two options of 7-year taxable and tax-free bonds. The former carried 13.5 per cent and the latter had an indicative band of 9-9.75 per cent which was finally settled at 9.70 per cent coupon rate payable half-yearly. The tax-free bond proposed to raise Rs 60 crore against which it received a commitment of Rs 72 crore. Response to the taxable bond (Rs 150 crore) is not known. From the government of Punjab there were two issues, viz, 2-year 12.3 per cent bond from Punjab State Industrial Development Corporation (PSIDC) aiming to Rs 25 crore and another issue from Punjab Roads and Bridges Development Board which plans to collect Rs 50 crore from the market. The payment of interest and the principal repayment for both the issues have been guaranteed by the state government.

Amongst the central PSUs, SAIL, which was downgraded by Crisil, has finally managed to sail through and collected Rs 150 crore with much difficulty, despite offering a high coupon rate of 14.5 per cent and a yield of 15.03 per cent; this reflected the present woes of the steel industry. On the contrary, the tax-free 7-year priority sector 11.5 per cent bond from Rural Electrification Corporation (REC) managed to meet with the targeted amount of Rs 170 crore.

Among the perennially borrowing FIs, ICICI was the only one to take the lower interest rate signal; it hit the market on March 10 offering the regular instruments with roughly half a percentage point less yield and mopped up Rs 450 crore against the issue size of Rs 600 crore (which had included Rs 300 crore greenshoe option). IDBI, which carried its issue from over the previous month, closed on March 15 after collecting the targeted sum of Rs 1,500 crore. IFCI's 7-year and 4-year privately placed LAAA rated bonds offering 14.1 per cent and 13.4 per cent rates of coupon, respectively, mustered Rs 200 crore, an excess of Rs 50 crore over the issue size of Rs 150 crore. The 4-year bond carried a put option exercisable after 2 years at 0.85 per cent discount. Thus, YTM works out to be 13 per cent when put option is exercised. SIDBI privately placed its 2009 (9th Series) Bonds at 12.35 per cent. The issue closed successfully on the same day after collecting the targeted amount of Rs 50 crore. NABARD, National Housing Bank (NHB) and Industrial Investment Bank of India (IIBI) were also in the market. There were two issues from NABARD in the private placement segment: (i) 7-year taxable priority sector 2006 bond proposing to raise Rs 200 crore at 11.25 per cent payable annually; (ii) 10-year SLR bond planning to collect Rs 116.23 crore at 12.35 per cent coupon

(-) means no trading YTM = Yield to maturity in percentage per annum CY = Current yield in per cent per annum * Yield rates of these sub-groups of t-bills and dated securities have been used for the graphs. Securities with small-size transactions (Rs 20 crore or less) and inflation linked bonds have been dropped from the above list but included in the respective totals.

Notes: 1) Yields are weighted yields, weighted by the amounts of each transaction
2) Current yield has not been worked out for treasury bills.

rate. NHB too offered 12.35 per cent on its 10-year bond for Rs 25 crore, whereas IIBI put an indicative band on its 10-year 'on-tap' SLR bond; the rate would be decided through the process of negotiation.

Among the banks, Citibank hit the market with 13 per cent 7-year bond as private placement to raise Rs 225 crore. This is for the first time that a foreign bank is raising resources in the domestic market to hike its risk-weighted capital adequacy ratio as per the RBI's modification of its policy to allow foreign banks to raise capital in the domestic market. Besides, there were other bank issues from Global Trust Bank, Bank of Baroda, United Western Bank, State Bank of Indore and Catholic Syrian Bank. The rates of interest for these issues ranged between 13.7 per cent and 14.5 per cent for the varying tenures of 63 months to 121 months. In all they proposed to collect up to Rs 804.75 crore. Amongst these, Bank of Baroda fetched as much as Rs 1,127 crore against Rs 600 crore (Rs 400 plus Rs 200 crore of greenshoe) followed by United Western Bank Rs 120 crore (Rs 50 crore plus greenshoe option of Rs 50 crore); Global Trust Bank raised Rs 67 crore against Rs 75 crore issue.

Almost all the issues that closed in the previous month were successful in meeting their targeted amount. In fact, some issues like those from GMIDC and KSEB were over-subscribed. In a surprising development, however, the Bharat Electronics (BEL) opted to withdraw its issue from the market on account of very few takers. The issue was LAA rated and offered 13 per cent rate of interest payable half-yearly. The coupon was the lowest in recent times for any PSU and hence the failure to press the issue.

It was reported that the union government has placed Rs 561 crore or 87 per cent of its debt holding in Nalco with banks and financial institutions. The issue was made through a six-year, 14.5 per cent non-convertible redeemable secured debentures payable semi-annually. At 14.5 per cent, the paper became most sought after commanding a premium of nearly Rs 3-5 in the market. The centre's action was the last leg of its disinvestment programme in Nalco. ICICI offloaded its NPAs of DLF Cements worth Rs 130 crore to DLF Universal. Besides reducing ICICI's NPA, the deal will also help Universal fetch a better price in the market. DLF Cement has been looking for a buyer.

Other Instruments

According to the data released by the RBI, there was considerable activity in the primary market for commercial paper but the yield rates were quite volatile. CPs reported during the first fortnight of the month were Rs 1,024 crore against Rs 762 crore in the previous fortnight. The latest issues were done at interest rates ranging from 8.50 per cent to 13.25 per cent; the rates have softened at the short end. The total CP amount outstanding as on March 15, was Rs 5,149 crore against Rs 1,030 crore about a year ago. The CD market has been generally dull as the banks now enjoy considerable freedom in offering interest rates on term deposits including offering differential rates based on the size of deposits.

IV
Secondary Market

Gilt-Edged Paper

The government securities market saw a zig-zag movement in prices during March. Initially on account of interest rate cuts, the prices surged sharply and the RBI had to intervene in the market by way of capping the rise on five-year paper. With call rates tightening during mid-March, the security prices saw some softening as players unwound their positions to generate liquidity. Trading remained lacklustre and prices remained stable towards end of the month as players awaited placement of a fresh issue in the market and refrained from taking positions. The possible impact of year-end trading on the yield curve for the entire 1998-99 also prevented traders from being active. The yield curve exhibited an unusually gentle upward slope (Graphs D and E).

The RBI concentrated correcting the yield curve through its OMO prices. While it kept the long-term yields more or less constant at around 12.33 per cent, it significantly lowered the yields at the shorter and medium end. The RBI remained quite aggressive on its open market operations window during March. It did total sales worth Rs 2,897 crore against Rs 2,590 crore in the previous month (Appendix Table).

As a consequence of the tightness in the overnight call market, the RBI's fixed-rate repo generally received no application or received one or two bids for amounts ranging from Rs 25 crore to Rs 400 crore during large part of the month (Table 7). Repo transactions outside the RBI were also meagre (Table 8). When government securities are excluded the NSE commercial debt trade was meagre during March (Table 9).

[V P Prasant, Rafiq L Ansari, Nandini Sengupta and Dipti Parikh were actively involved in the preparation of this note].

Dynamic Credit Policy

The Only Hope of Economic Revival

EPW Research Foundation

Against the background of output, price and monetary trends, credit policy has to be decisively expansionary. Further, after having achieved considerable reduction in interest rates in the recent period, the issue is no more one of the cost of credit; it is rather that of availability and supply of credit and its distribution.

THE impending monetary and credit policy generally for 1999-2000 and more specifically for its first half, scheduled to be announced on April 20, is conceivably being formulated under unusual and extremely challenging circumstances. First, the Indian economy is facing a severe shortage of demand in general and persistent sluggishness in industrial growth and investment in particular. Second, as a result of an acute fiscal laxity and fiscal compression, which are primarily responsible for the crisis situation in the real economy as well as in the financial system today, the burden of economic revival has fallen disproportionately on monetary and credit policies. The repeated pressures that are being put on the Reserve Bank of India (RBI) for further reduction of interest rates, for instance, are an example of how the government is endeavouring to cover up its own fiscal policy failures in reviving the industrial economy. Finally, when the RBI governor now wants to bring to bear some fresh perspectives on monetary policy formulation, showing some candid and significant departure from the earlier policy stance, he is faced with stupendous structural, institutional and even organisational constraints within the banking and financial system in achieving the desired goals.

In fairness, it must be admitted that the present RBI governor, immediately on assuming charge in November 1997, sent out clear signals on his desire to apply newer perspectives. On the one hand, he admitted that the analytical framework underlying monetary policy until then, which had accepted the stability of the money demand functions and monetary targeting as the cornerstone, required rethinking. On the other, simultaneously, the governor sought to address the institutional and structural constraints of the financial system. Apart from appointing three committees – two one-man committees for studying credit delivery in agriculture and small-scale industries and a working group on harmonising the regulatory environment for banks and DFIs, the RBI had expressed its serious concern on slow offtake of credit and advised bankers "to step up the flow of credit by activating the functionaries at operative levels and to monitor the credit growth on a monthly basis. The bankers were advised to convene meetings of regional and zonal heads and visit some of the branches to monitor the situation" (RBI press release of December 6, 1997).

The truth is that such an eclectic approach to credit policy formulation and its administration, unlike in the case of strait-jacket monetary targeting exercises, is much harder to get it translated into definitive action programmes at the operational level. It requires two things: first, the broader developmental linkages have to be brought to bear on the deployment of monetary and credit policy instruments such as the link between credit, output and employment activities in different sectors and regions; and second, an honest and efficient system of monitoring both the physical targets set and the qualitative changes aimed at, should be put in place. Against this yardstick, the steps so far taken by the RBI in the recent period seem to have fallen far short of the expectations; they seem to lack the drive, the thrust to galvanise the banking and financial system to fulfil its obligations and thus help achieve the objectives of monetary and credit policy, the most crucial one of which is to endeavour to provide adequate credit for production and investment purposes. A critical evaluation of performance of banks at their operational levels in regard to credit delivery is sure to drive home the point made here. Therefore, in the immediate context, the monetary and credit policy for 1999-2000 has to address a few crucial concerns.

First, the focus on monetary targeting has deprived the banking system of definitive guideposts on the relative size of bank credit and its distribution. Just the time when many important countries were giving up monetary targeting and beginning to take a 'credit view' of monetary policy, the Indian authorities began to embrace the outdated concept. Be that as it may, it would be very appropriate for the current situation in particular to restore the focus on credit and its distribution as an instrument of development. Second, certain elements of policy, particularly those relating to capital adequacy norms, have hindered the growth of commercial credit in the recent period. Therefore, apart from the prescription of direct measures to accelerate credit delivery, it is necessary to introduce relaxations in some of those norms so that the banks are encouraged to render such commercial credit. Finally, the RBI has a stake in establishing arrangements whereby social goals of policy and policies of a moral suasion nature are systematically and vigorously monitored and the results shared with the respective bank boards.

Against the background of output, price and monetary trends, two broad principles should govern the monetary and credit policy formulation in the current context. First, the policy has to be decisively expansionary; the depressed economic activity on the one hand, and the prevalence of moderate inflation, on the other, permit such an expansionary credit policy. Second, now after having achieved considerable reductions in interest rates in the recent period, the issue at present is no more one of the cost of credit; it is rather that of availability and supply of credit and its calibrated distribution.

No Case for Interest Rate Reduction

Any forced reduction of interest rates at the banks' level is sure to hurt their viability. Major banks have reduced their prime lending rates (PLRs) to 12 per cent, some ruling still at 13 per cent. Also, the spread has now been restricted to four percentage points. The RBI's basic statistical returns (BSR) for March 1996 showed that as much as over 60 per cent of total bank credit (above Rs 25,000 each) or over 45 per cent of aggregate bank credit carried interest rates of 17 per cent and above. Such high incidence of interest rates on bank loans would not be prevalent anymore.

As for its comparison with inflation rate, it should be admitted that in the Indian case the expected inflation rate is around 8 per cent and not 5 per cent as prevailing at present. For the manufacturing firms, interest rate is a tax deductible expenditure. The old argument that to some extent, the level of interest cost should serve as some disciplining factor in the use of credit, is still valid. In the existing interest rate structure, what has contributed to some distortion is the charging of very high rates of interest on investment credit by term-financing institutions – higher than even the rates on working capital loans charged by banks. As indicated below, this requires correction at the FIs' end. The only other reduction called for relates to some downward adjustment in export credit.

Any other generalised reductions in the lending rates of banks would have their repercussions on their deposit rates which, at present ruling in the range of 9 per cent to 11.50 per cent for different fixed deposit maturities in different banks, cannot be considered as high. As it is, with the blanket tax exemption on dividends earned on units of all mutual funds including the UTI, a situation of severe competition has arisen for bank deposits, the growth of which has clearly decelerated in recent months.

The Desired Measures

First, the cash reserve ratio (CRR) has been accepted as one of the potent instruments of liquidity management, though the long-term goal of reducing it to more moderate levels deserves to be pursued, particularly when it is placing commercial banks in a disadvantageous position *vis-a-vis* the FIs. The potential liquidity situation during 1999-2000, would call for injecting additional liquidity through a further reduction in CRR. Such a reduction of about one percentage point in two stages, half a percentage point each, to a level of 9.5 per cent would release about Rs 7,000 crore of liquidity or Rs 3,500 crore in each instalment. This could be done in May (in the midst of the peak food procurement credit) and in November-December next year to serve the possible busy season credit requirements.

Second, the banks are to be asked to achieve a gross non-food bank credit to deposit ratio of 60 per cent gradually by the end of March 2000. Including banks' investments in capital and money market instruments (except equity shares), the ratio as of March 26, 1999 stood at about 55 per cent, or in incremental terms it worked out to 47.8 per cent for 1998-99. Apart from the norm of credit-deposit ratio, the RBI should derive an estimate of desirable level of incremental credit for 1999-2000, and if banks' deposit growth falls short of the requirement, some special refinance window may be activated to supply liquidity support to banks.

Third, the importance of priority sector credit norm of 40 per cent has been stealthily diluted by including a number of new elements like indirect credit for agriculture; the banks have also been allowed to give the backlog as loans to SIDBI and NABARD. One of the harshest aspects of the present credit delivery system has been the general neglect of small and priority sector borrowers. Prescription of sectoral norm for agriculture, small-scale industry and small borrowers does not amount to micro-level influencing; there are millions of such potential borrowers who deserve to be catered to by banks. It is the lackadaisical monitoring of the RBI that has been responsible for a general neglect for small borrowers; this in turn was because under the influence of mainstream structural adjustment programme, the central bank at that time had lost faith in the system of directed credit. It is time that some vigour is introduced to the implementation of R B Gupta (in agriculture) and S L Kapoor (small-scale industry) committee reports in letter and spirit. The same organisational vigour has to be introduced in the general credit delivery system so that bank personnel imbibe the genuineness of providing adequate bank credit to productive sectors – a promise the RBI keeps giving ad nauseam. The RBI has to be assured of organisational preparedness by banks for credit delivery as well as credit recovery. Some systematic monitoring of such arrangements should not imply interference in the day-to-day functioning of banks; it is only to ensure that the credit policy goals are truly achieved in letter and spirit.

Fourth, apart from the organisational issues, banks have been deterred from rendering commercial credit for two reasons: difficulties faced by manufacturing firms to fulfil their repayment obligations in a situation of depressed economic activity and increased rigours of risk-weighted capital norms. No doubt, a vicious circle has set in whereby depressed output and investment activity has hurt cash flows of corporates, which in turn has made banks shy away from lending to commercial units. In such a situation, banks alone can break the vicious circle, and it is possible because there is a continuum in the production and trading cycle and there are many units in the commercial loop which are capable of absorbing higher bank credit if banks considered commercial lendings as one of their crucial obligations, with of course appropriate safeguards. Today, there is a blanket resistance to lending to corporates, particularly small and medium ones. With regard to the provisioning of minimum capital to risk assets ratio (CRAR), the current environment, where the credit flow is choked, calls for relaxation. The minimum that should be done is to postpone the implementation of the measures taken in October last; in particular the increase in the CRAR from 8 to 9 per cent for the year ending March 31, 2000 deserves to be suspended as a signal to banks to promote improved credit delivery.

Fifth, encouragement to credit expansion for priority sectors can also be done by opening a refinance and rediscount window for banks against such lendings. The special liquidity support given to banks against government securities worth about Rs 3,235 crore having been being extinguished, a similar amount could be used for the above purpose.

Sixth, a more potent instrument of injecting liquidity, albeit selectively, could be applied in the case of development finance institutions (DFIs) for on-lending term credit in favour of industrial investment and infrastructural development. Each year the RBI could set aside about Rs 5,000 crore for this purpose. Infusion of such funds by the RBI in favour of the DFIs may help the latter from putting pressure on the capital market and pre-empting funds therefrom; this may facilitate the manufacturing firms to resort to equity issues and may thus help the revival of the primary capital market.

Finally, on the interest rate front, two steps are required. First, the earlier facility of providing export credit refinance facility at two percentage points less than the Bank rate deserves to be restored. In the post-budget announcement of the credit policy on March 1, the RBI has said that the export credit refinance will be provided to banks at the Bank rate (which is 8 per cent now). Secondly, and more significantly, the RBI should intervene in the fixation of coupon rates on commercial bonds and introduce a ceiling at say about 12.5 to 13 per cent for banks and FIs and at about 14 per cent for manufacturing firms in the public and private sectors. Besides, all bond issues are required to be compulsorily rated. These measures will have some positive impact on the capital market.

Adult Education: A Tale of Empowerment Denied

Vimala Ramachandran

The National Adult Education Programme and the Total Literacy Compaign (TLC) failed to live up to their initial promise. Corruption undermined the former, a grants-in-aid scheme, and a quick-fix approach the latter, besides the stress on the commitment of individual administrators rather than on system reform that injured both. One upshot was that an opportunity for the empowerment of women that unexpectedly presented itself was squandered.

THE early fifties were euphoric days for India. We had confidence in the future, in our people and in the capability of the system to deliver the goods. China was working wonders in the field of education. We were confident that we too could do well. There was a feeling that adult literacy would happen in our country in due course. Of course, it was not on the priority list. The Nehru era focused on infrastructure development, the building of institutions of higher education and technical education, and primary education. The Education Commission (1964-66) raised the issue of adult literacy and called for 'liquidating illiteracy', advocating a selective as well as mass approach. But that did not translate into concrete programmes.

It was not until after the emergency of the mid-seventies that the government decided to initiate a nationwide programme for the eradication of illiteracy. The National Adult Education Programme (NAEP) was launched on October 2, 1978. The 1970s was an era of radical literacy movements which saw literacy as an emancipatory tool.

In the immediate post-emergency period the NAEP created space for the involvement of non-governmental organisations and social action groups in the literacy movement. This was hailed as a progressive step. The government was not seen as the primary vehicle for adult literacy and empowerment at that time. The programme was motored by a scheme of grants to voluntary organisations. Gradually, however, the government created adult education units with the mandate to run literacy classes. Given the severe resource crunch, the government relied on part-time instructors who were paid very modest honorariums. It was argued that this was just a token effort designed to encourage young rural men and women to teach adults in their own community.

The intended goal was education, not just literacy. Literacy was seen as a tool in a larger effort to create awareness. It was believed that this would give adults the confidence to reach out to information and knowledge, acquire new skills and walk with their heads held high. During the early years, the NAEP evoked a great deal of enthusiasm. The voluntary sector was just emerging as a force to reckon with. These "non-party political formations" were hailed as harbingers of social change – which the election-oriented political parties had ceased to be. Given the post-emergency scenario in India, the very presence of community-based social action groups and voluntary agencies was seen as a triumph for democracy. The decisive electoral verdict against Indira Gandhi in 1977 and the restoration of democratic processes thereafter seemed to signal the beginning of a new era. The post-emergency euphoria coupled with the recognition that the state alone could not deliver the goods in an iniquitous market-oriented society acted as a spur for new movements, organisations, activities and actors. Though Indira Gandhi returned to the helm in 1980 voluntary organisations had come to stay by then, as had the literacy programme. Something had changed between 1975 and 1979.

What Went Wrong with NAEP

The centrality of popular education in workers' struggles and radical movements had come to be accepted by the late seventies. Education for social justice and equality was the slogan of that era, extending into the early eighties. Entrusting the task of adult education to the emerging voluntary sector seemed to be a logical step. While this situation was sought to be exploited by opportunists with an eye on the readily-available funds, it also set the stage for many genuine groups inspired by Paulo Freire and Ivan Illich to do remarkable work in participatory learning.

Unfortunately, the NAEP got discredited within 10 years of its launching. Anil Bordia, the dreamer who conceptualised the programme and nurtured it during the first few years, admitted this: "As it consciously tried to move away from being identified with the government programme, it provided for greater participation of voluntary agencies...Inherent structural deficiencies, coupled with inflexibilities of all kinds and at all levels – in the timing of the centres, in numbers enrolled, in the provision of funds, and in the bureaucratised, hierarchical attitudes – led to a situation where the NAEP, which had had a promising start became another ineffective government programme" [Bordia and Kaul 1992].

What were these 'inherent structural deficiencies'? Systems set up for making grants and monitoring their use did not function well: corruption, misutilisation of funds (especially by influential people who set up voluntary organisations), grossly inadequate payments to literacy instructors and abysmal support structures eroded credibility. Evaluation showed that many voluntary organisations did little. There were many cases of bogus organisations receiving funds, and in some areas the programme became yet another patronage network of the powerful. There were examples of organisations that received enormous funds but made little impact on literacy levels. While there were also examples of pathbreaking work, such success stories were few and far between.

Having invested millions of rupees, the government decided to switch to a campaign mode in 1988 when the NAEP was wound up and the total literacy campaign (TLC) launched. The emphasis changed from adult education to adult literacy.

The decline of the NAEP sent out the signal that problems were inherent in government-sponsored, centrally-administered grant-in-aid schemes. Given the prevalent administrative culture, any grant-in-aid programme faces the danger of partisanship and politicisation. Creating administrative and financial systems that are transparent and accountable, and sustainable as well, is not easy. The difficulties did not receive due attention. The administrators who designed the programme placed too much reliance on the capabilities of committed civil servants. The importance of transparent systems for selection of voluntary agencies, rules, regulations and objective criteria for the evaluation of progress was not adequately appreciated.

Outdated grant-in-aid procedures shrouded in bureaucratic secrecy, erratic financial flows and a tendency to keep the voluntary agencies on tenterhooks *vis-a-vis* grants further compounded the prob-

lem. This system bred petty corruption. It was not uncommon for voluntary organisations to pay speed money to ensure timely release of funds. The sad truth is that such phenomena are widespread in grant-in-aid schemes in the fields of education, women's development, rural development, environment and so on.

Nor can we place much reliance on administrators having activist inclinations and endowed with charisma. Such administrators make little effort to initiate reform within the system. Impatient with mainstream structures, they are given to bypassing the system and creating alternative management structures. What they apparently fail to realise is that the mainstream administrative culture gradually eats into alternative structures. Such administrators refuse to acknowledge the inherent limitations of a charismatic leader model. Rarely looking beyond their tenures, they seem to ignore the prevalence of corruption and mismanagement in such system. The upshot of all this was that many social activists and organisations who had done good work through the NAEP gradually moved out of 'adult education' and went into participatory development. Most of them opted out of government schemes and started mobilising funds from donor agencies. Decline in the NAEP's credibility had led to widespread disillusionment with the very concept of adult education.

FROM ADULT EDUCATION TO LITERACY

As in the case of the NAEP, voluntary organisations, social action groups and village-based social animators were the mainstay of the TLC. But there was a difference. The literacy mission was positioned as a time-bound campaign involving a wide range of actors as 'partners' in social mobilisation. The centre-based approach gave way to intensive time-bound literacy classes conducted by volunteers. 'Zilla saksharata samitis' (district literacy societies) were created to bring together people from the administration, voluntary groups and national resource agencies like the Bharat Gyan Vigyan Samitis (BGVS), an offshoot of the communist movement in Kerala, as well as individual social activists. This structure was created to transfer initiative to the community and generate a momentum for literacy through creative environment-building. Jathas – processions for social mobilisation which use theatre, music and dance as tools – were to be the instrument of environment building.

Literacy volunteers were recruited and trained. They were asked to run classes for six months – in which time the adult learners were expected to complete learning the first primer. The scheme also provided for post-literacy centres called Jana Shikshan Nilayam. The fulcrum around which the entire campaign was to revolve was the district collector – who was also the chairperson of the zilla saksharata samiti, a government-created autonomous society. It was hoped that this structure would foster genuine partnership between the district administration and social activists, community leaders, eminent people and of course ordinary citizens interested in working for the campaign.

Civil servants were expected to initiate and lead a mass campaign. They were also expected to galvanise the entire administration to work in campaign mode. In short, they were asked to keep their bureaucratic training to one side and plunge into social activism. The legacy of the dispassionate and neutral civil servant was laid to rest.

Like the NAEP, the literacy campaign was designed for the exceptionally committed or exceptionally ambitious civil servant. It was beyond the reach of routiners howsoever competent. The Zilla Saksharata Samiti was to have a great deal of flexibility. It was expected to combine the outreach and authority of the government with the flexibility of voluntary organisations. The 'empowered committee' – the executive committee – was to include representatives of civil society. Funds were to be channelled directly from the union government, the state governments being bypassed.

When the country was plunged into a communal cauldron during the early nineties, a social worker from Uttar Pradesh commented that the expenditure incurred on the literacy campaign, an election campaign and the Ram Janmabhoomi campaign were not different from one another: who can tell how many organisations secretly fed and housed 'kar sevaks'. The reality is that there was no foolproof system to monitor the environment-building stage of the TLC. The system hinged on the key administrators' political proclivities. While the department of education (ministry of human resources development) appointed people with known secular credentials in decision-making bodies during the early years, Indian politics itself was changing colour in the mean time. Such criticism notwithstanding, the TLC did capture the imagination of many organisations, civil servants and ordinary people.

Women responded in large numbers making the campaign a potential force for the mobilisation and empowerment of women. Such unexpected spin-offs emerged as the greatest validation of the campaign. In an otherwise bleak scenario, this aspect of the literacy campaign reopened the debate on education as a tool for women's empowerment and equality. The women's movement, which had hitherto had an ambivalent stand on adult education and literacy, took note of the mobilisation of women, particularly in Pudukottai district of Tamil Nadu and Nellore district of Andhra Pradesh – where it was unprecedented.

In Nellore, a coastal district, the initial

social mobilisation for literacy in 1991 was successful, and many women came forward to participate in literacy classes. One seemingly unimportant chapter taught in the classes described the effect of alcoholism on the family and the efforts in some parts of the country to fight the social evil. Maybe the time was just right or maybe the women of Nellore were quite fed up with the havoc alcohol has created in their lives, but this chapter galvanised them. Almost overnight, thousands of women came out of their homes, and the 'anti-arrack' movement of 1992 was born. District officials involved in the literacy campaign were not just sympathetic to the movement. They encouraged it. As the movement picked up momentum, the state government declared prohibition in April 1993.

Changing government policy was a heady experience, and during one of the victory celebrations women discovered the magic formula of self-help groups. This discovery led to the birth of the savings movement. In just two years, nearly 6,000 savings groups called 'Podupulakshmi' came up. The government then decided to create a women's bank. This was a mistake. Women who had got used to handling their own money and who had experienced the power of decentralised decision-making were reluctant to hand over their savings to an impersonal banking system. The savings movement lost its momentum and gradually petered out, though many groups reportedly continue to function quietly.

In Pudukottai, an impoverished district, the literacy campaign led to unprecedented mobilisation of rural women in 1992. The bicycle became the instrument of empowerment of women in this area. Thousands of women learnt to ride it. Acquisition of the means for greater mobility alongside literacy skills was the distinguishing feature of the campaign as it developed in this district.

The women of Nellore and Pudukottai may not have mastered literacy skills, but the literacy campaign changed their lives. As Avik Ghosh observed in 1997:

> The...anti-arrack movement launched by rural women in Nellore district became possible because the literacy centres provided a forum for women to meet, share experiences and discuss issues.. While it was never the national literacy mission's intention to create confrontation between people and the administration, the facilitative factors of a volunteer-based and loosely structured programme provided the space for people to think and act freely. The district officials and the literacy workers, on their part, facilitated and provided positive support to their cause...The TLC provided, for the first time on such a large scale, a forum for participation and dialogue, discussion, learning and sharing among volunteers (agents of change) and learners (those desirous of change).

Large-scale campaigns impart dynamism and the will to change to their participants, and this was more than demonstrated in some districts in the context of the TLC. Literacy classes and the group discussions, experience-sharing, access to information and collective action associated with them generated their own momentum. Evaluation reports and travel notes of those who visited the TLC districts show that people belonging to traditionally disadvantaged groups like the scheduled castes and the scheduled tribes participated in large numbers. Women jumped into the arena with great enthusiasm.

It was too good to last. The literacy mission lost in 1993 the momentum it had gathered from 1989 to 1992. Campaign managers and administrators sitting in Delhi and in state headquarters had belied the hopes of thousands. It is now widely known that the literacy classes could not be sustained everywhere and that the continuing education programme was a non-starter. Shoddy planning, red tape and the unfortunate lack of continuity in the policies and practices of the government (as represented by senior officers) led to the demise of an otherwise exciting process. Studies conducted in Birbhum, Bilaspur and Dumka districts by the Centre for Media Studies, New Delhi in 1998 confirmed the worst fears of observers. Not much literacy happened, though people might have learnt to sign their names. But the campaign did lead to greater demand for primary education for children.

The culture of 'undo what my predecessor did' affected the literacy campaign. Moreover it was realised that the campaign was floundering in many districts. The government therefore launched 'Operation Restoration' in 1994. Twenty-five districts, most of them in 'resistant' states, were selected for special attention. It is difficult to make any categorical statement on the success of Operation Restoration. The available evidence, anecdotal and patchy, does not speak of any spectacular turnaround.

The literacy mission demonstrated that given the right environment and the right stimulus the state machinery could be galvanised into creative action. It also demonstrated beyond doubt that people, especially women, are not apathetic to learning. Beyond a particular stage in life they may find literacy skills difficult to acquire and retain, but enthusiasm for learning and acquiring knowledge does exist. Women participated in large numbers, not because they wanted to learn the three Rs but because the campaign opened a window to the world outside. Women may not have learnt to read and write, but they certainly learnt to think, question themselves, speak their minds and work collectively.

Missed Opportunities

The literacy campaign is a story of missed opportunities. Wherever the campaign made an impact, women came forward. Poor rural women got a glimpse of a brave new world. In Nellore women came out of their homes, made alliances, worked closely with the administration and tried to change government policy. This generated greater awareness of social issues and encouraged the women to think strategically. The anti-liquor movement gradually gave place to the savings movement. Women formed groups to pool their savings and tap the corpus thus created for consumption and production loans. It was estimated in April 1995 that there were 6,600 savings pools bringing together more than 2 lakhs women. The groups had mobilised Rs 6 crore and gained access to Rs 3.75 crore through the Integrated Rural Development Programme (IRDP), and the Development of Women and Children in Rural Areas. It was an exceptional success story. It spawned a move to initiate a movement called 'People's health in people's hands'. The environment could not have been more favourable.

Here was a historic opportunity to use education as a tool for the generation and consolidation of people's power. But it was not to be. Adult educators and campaign managers packed their bags and left. They did not recognise the potential of a village-level institutional base for the promotion of life-long learning. The Andhra Pradesh government saw in the savings movement only an opportunity to build a women's bank. The confidence women in Nellore gained through the literacy campaign, the anti-arrack movement and the savings movement is still with them, but they have lost their collective strength. Women in Puddukottai, where cycling came to represent mobility and autonomy for women, narrate similar experiences.

After one has talked to a wide range of actors involved in the literacy campaign, a disturbing picture emerges. There was no strategic thinking – either in New Delhi or at the district level. Collectors, like most career civil servants, have a short time horizon. The literacy campaign gave them an opportunity to shoot into prominence, make a splash and then move on.

The painstaking process of nurturing a movement, helping ordinary people consolidate their new-found identity and strength and building sustainable organisational structure is alien to the civil service ethos. Unfortunately for India's development administration the average administrator does not think beyond his own tenure of, say, three to five years. The administrative culture does not encourage building on the achievements of predecessors. On the contrary a tendency to negate the contributions of predecessors has taken hold.

The literacy campaign was launched and justified as a quick-fix movement for the "eradication" of illiteracy. It was never conceived as a spark that would ignite a movement for lifelong learning.

The country seems to have given up strategic planning during the early seventies. What it needs are programmes with a long-term vision, whether the goal be child survival, safe motherhood, adult literacy or universal primary education. Quick-fix campaigns can at best provide the initial momentum. Again what we need to do is recognise the inherent limitations of our system and design programmes and schemes that are not dependent on the individual commitment, values and proclivities of extraordinary civil servants. We need transparent processes and systems which are open to scrutiny by the public – to be administered by run-of-the-mill civil servants who are accountable.

Chipko Movement: Of Floated Myths and Flouted Realities

Jayanta Bandyopadhyay

On the 25th anniversary of the Chipko movement, this is a tribute to the courageous activists and men and women of determination who brought Chipko from a possible instrument of struggle to a trend-setting achievement. Also an examination of media created 'messages' to dispel some of the myths about the movement, in particular, the question was Chipko about economics or deep ecology and was it feminist.

ON March 26, 1999, a quarter of a century had passed since a group of women in the Reni forests of Garhwal Himalaya succeeded in chasing away timber felling contractors. In course of time this event became a milestone in the evolution of the world famous Chipko movement. An impressive and useful bibliography on the literature around the movement has also developed since then. A number of activists with remarkable philosophical richness and social commitment have devoted their lives to this movement, which is one of the most written about in the world today.

In spite of the volumes of literature, or probably because of it, there appear some serious gaps in the public impressions and actual realities of the movement. Myths have often flouted realities, individuals with no links with the movements have often been projected by the media as its leaders. Thus, some widely accepted yet mistaken concepts have gained currency. There is a need to re-establish the realities about the movement and to honour the selfless hard work of the numerous less-known and unknown Chipko activists.

As a student of environmental activism, over the past 20 years, the author and his associates have travelled extensively through mountain villages in large parts of Garhwal and Kumaon Himalaya, where the Chipko movement emerged. This article is written as a tribute to the numerous and largely unknown activists of the movement on the occasion of the 25th anniversary of the successful forest protection action in Reni under the leadership of Gaura Devi, head of the local village women's organisation. It is also aimed at a wider examination of the reliability of media created 'messages' and dispellin some of the myths about the movemen that have floated around for quite some time. The article addresses questions suc as is Chipko a movement rooted in eco nomic conflicts over mountain forests o guided by ideas of deep ecology; is it social movement based on gender col laboration or a 'feminist movement' base on gender conflicts; and has anyone in th Chipko movement actually hugged tree at the risk of her/his life and not for waitin photographers.

Documented evidence from the move ment sources does not indicate any influ ences of the brand of thinking known a 'deep ecology'. Dependable historica account of this widely written abou movement is, surprisingly, scanty. Amon the early writers on the history of th movement, Bandyopadhyay (1992) as wel as Guha (1989) have not indicated an link with 'deep ecology'. On June 24 1973, the first successful resistance t forest felling at the Mandal forests wa based on economics and aimed at obtain ing higher allotment of trees for felling t the Dasholi Gram Swarajya Sang (DGSS), a local Gandhian organisation On March 26, 1974, the more vociferou yet non-violent resistance at the Ren forests was triggered off by the news o auction of some local forests for fellin to a sports-goods company from the plain The contract system for forest fellin allowed rich contractors from the plain to make large profits from fellings in th mountain forests. The basic theme of th movement as opposition to this practic is precisely expressed in the followin lines from a famous poem by Raturi, th folk-poet of the movement:

Embrace the trees in the forests
And save them from being felled!
Save the treasure of our mountains
From being looted away from us!!

The movement had its beginning in th conflicts over mountain forests betwee the economic interests of the mountai communities and the economies of th plains. However, this fundamental basi of the movement got substantially reduce when the contract system of felling wa stopped and the public sector Fores Development Corporation was established The fellings were undertaken with th help of local village co-operatives.

Reference in the literature is frequentl made to an environmental branch of th movement, which called for a total ban o commercial fellings in the whole Garhwa and Kumaon Himalaya. This part of th movement is reported to have originate in the Tehri-Garhwal region, particularl

the Henwal valley region, and is identified with the slogan:

What do the forests bear?
Soil, water and pure air!!

The slogan is an excellent and simple summarisation of the ecological importance of the mountain forests, especially in the Himalayan context. Many academic analysts, including the present author, had unhesitatingly accepted the slogan, when first informed about it. However, with the passage of time, several questions on the representative character and origin of this slogan have emerged. Notwithstanding the significant role played by the women of Henwal valley region in the protection of mountain forests, many women in the Garhwal and Kumaon region do not find the slogan very realistic. Can the women in the mountain villages who spend several hours each day in the forests struggling to collect daily firewood and green fodder, ever forget to include them in the list of important forest products, they ask. The convoluted argument that firewood and green fodder can grow only when there is soil, water and pure air, and hence they are secondary, appears too distant, theoretical and urban in the face of the hard struggle for survival in the rural mountain villages.

Naturally, the slogan has impressed urban environmentalists the world over but, for the women in the mountain villages who struggle to keep the cooking-fire running and the domestic cattle well-fed at home, the slogan is an abstract one, at best a reflection of half-truth of their lives. This point indicates why the ecological message of the Chipko movement has impressed environmentalists in the urban areas and the countries of the north, much more than those in the mountainous hinterlands in the south. However, there is also a positive side to it. Much of the success of the movement in getting tacit political support lies in this capacity of the leadership of the movement to mobilise the vocal and urban environmentalists. Thus, in line with the distinction made by Guha (1989), the Chipko movement has the private face of a quintessential peasant movement and a public face of one of the most celebrated environmental movements of the world. Chipko has its roots in the hard economic struggle for survival, while its face has been tactically decorated by some 'deep ecological' terms.

In the early literature on Chipko no serious questions were raised about the movement being based on gender conflict. There was no lack of recognition of the fact that the issue of forests in the Garhwal and Kumaon Himalaya touches the women much more intensely than the men. The presence of large number of women in the forest action at Reni, and the large-scale participation of the village women have led to some analysts claiming that Chipko is a 'women's movement'. Guha (1989) has answered these questions in a substantive manner showing the location of Chipko in the tradition of social movements of the region. However, in spite of that, Shiva (1992), identified Chipko as 'a women's movement', though no activist woman from the movement has made any such claim. The acutely subjective nature of such claims and the confusions they generate can be explained by a closer look at the way the protest led by Gaura Devi in 1974 is seen from the ecofeminist viewpoint. As Guha (1989) describes, "Reni's importance in the saga of Chipko andolan (movement) is two-fold. It was the first occasion on which women participated in any major way, this participation, moreover, coming in the absence of their own menfolk and DGSS activists."

Guha has elaborated on how the officials made a clever move to get the menfolk and the DGSS activists away from the villages around Reni forests, so that felling could be undertaken without resistance. The forest officials were concerned about the resistance to forest felling by both men and women. As Gaura Devi, the woman leader of the forest action at Reni explained [Guha 1989]: "It was not a question of planned organisation of the women for the movement, rather it happened spontaneously. Our men were out of the village so we had to come forward and protect the trees." This clearly establishes the nature of the movement as a joint struggle based on gender collaboration. Thus, while the men in the concerned villages were diverted by a clever official move, the women took up the mantle of resistance.

Interestingly, Shiva's (1992) description of the same incidence, from an ecofeminist viewpoint merely says: "A group of village women led by one Gaura Devi hugged trees, challenging the brute power of hired sawyers, about to cut down the trees for a sports-goods company." This statement suffers from reductionist drawbacks and distortion of facts. Due to the reductionist view, Shiva is unable to see the Reni action in a holistic perspective. Thus, the link between the steps taken by Gaura Devi and the contrived absence of the men in the village has been missed in her analysis.

Referring to the contrived absence of the menfolk of the village, Guha (1989) describes the same incidence thus: "Gaura Devi quickly mobilised the other housewives and went to the forest. Pleading with the labourers not to start the felling operations, the women initially met with abuse and threats. When the women refused to budge, the men were eventually forced to retire...As such, even at the level of participation Chipko can hardly be said to constitute a women's movement."

Gaura Devi herself did not mention any incidence of having led the women to embrace trees, as has been projected by Shiva (1992). This is historically incorrect. In the ecofeminist literature on Chipko, the women of Garhwal and Kumaon have often been described as opponents of change and mere carriers of tradition. Similarly, the menfolk are described as rapacious agents of economic development and change. Realistic, holistic and painstaking research results by scholars in the same region have, fortunately, provided a different picture [see for example Mehta 1996]. More recently, such myths have been more effectively exploded by the leading roles played by the women of Garhwal and Kumaon in the popular movement demanding a new and development-oriented state in this mountain region.

Notwithstanding sensationalist writings, the women activists of the Chipko movement have considered that the movement has strengthened itself from gender collaboration against the inappropriate management practices for the mountain forests. Women have played significant roles in the movement, just as their male counterparts. There is no reason for seeing the Chipko movement as based on gender conflicts.

A common impression exists all over the world, except in the villages of Garhwal and Kumaon, that large number of people, especially women, have been embracing trees to prevent their felling. While the media has played an important role in spreading the positive message of the movement, some journalists have failed miserably to maintain minimum professional standards and have created serious confusions at the international level on the above question.

In a magazine *Sanctuary*, Shiva (1992) declared that 'one Gaura Devi' led a group of village women to hug trees. A number of researchers had discussed the Reni action with Gaura Devi. However, there is no documented support to the claim of Shiva. She was neither present at the spot in Reni, nor does she refer to any discussion with Gaura Devi. There has been a media created confusion on the issue of who embraced the trees in Chipko movement. This has also disturbed the activists of the movement.

The spreading of misinformation is taken to comical heights by a Malaysian journalist Fong (1996) who, in an article in *The Star* wrote: "Her (Vandana Shiva's) name is synonymous with the Chipko movement (Chipko means embrace) in India, an active anti-logging movement in the 70s and early 80s. To stem environmental destruction, Vandana (Shiva) led thousands of women to embrace (literally) the trees in the Himalayan mountains in their bid to stop logging activities." In the characteristic style of sensationalist journalism, Fong (1996) does not provide any date, place, forest area, or villages associated with the incident he reports. Nor does he mention one name out of the thousands of women that Shiva, reportedly, had led somewhere in the Himalayan mountains. The activists of the Chipko movement, though partly amused, wrote a letter of protest to the editor of *The Star*: "The interview is based on false claims of Vandana Shiva and has angered many...The real activists are so simple that they do not know why Vandana Shiva is reportedly publishing wrong claims about Chipko in the foreign press. We should all stand up against this new green exploitation of the people's simplicity and courage by clever, greedy and selfish persons like Vandana Shiva" [Jardhari et al 1996].

Contrary to all the unfounded greenish journalistic attempts in the international media, to garner the glory of the Chipko movement, there has so far been only one reported instance of actual use of the method of embracing trees, and that too by a male activist. In the year 1977, Dhoom Singh Negi, a courageous and lesser known Gandhian activist from the village Pipleth, successfully prevented felling by embracing trees in the Salet forest area in the Garhwal Himalaya, as has been reported by Shiva and Bandyopadhyay (1986). In all other instances of Chipko movement, resistance was expressed in other nonviolent forms. In most cases, the presence of a large number of angry villagers was enough to discourage the contractors from trying to fell trees.

All photographs of 'Chipko Actions' represent enactments. When the only reported incidence of embracing trees to protect them from felling occurred in Salet forests in the Garhwal Himalaya, and human life was at risk, there was no photographer around in the remote mountain forests.

Many courageous activists, men and women of determination, have brought 'Chipko' from the stage of a possible instrument of struggle to the stage of a trend-setting achievement. Individuals like Dhoom Singh Negi are busy working in their small and remote Himalayan villages for the cause of sustainable human development. On the occasion of the completion of a quarter century since the mountain women's action at Reni forests in 1974, this article is a tribute to all of them.

Welfare and Well-Being in Modern Mexico

David Barkin

The restructuring of Mexican economy and the reorganisation of the state have changed the government's relation to the people, redefining the responsibilities for creating opportunities and resolving social problems. This article reviews the impact of structural changes on the well-being of the principal social groups and the government's response to the profound problems of neoliberalism.

THERE is ample recognition that the process of globalisation is causing growing polarisation in all dimensions of social life: among regions, social classes and people. In spite of the unprecedented volumes of material production, international trade, and international capital flows, in virtually every society a crisis of lack of gainful employment and declining levels of individual welfare appear to be the unavoidable results of a new system of globalised production. The restructuring of the Mexican economy and the reorganisation of the state during the past 20 years dramatically changed the government's relation to the people, redefining the responsibilities for creating opportunities and resolving social problems that arise as a result of the new order. In this short article, I offer a review of the impact of these structural changes on the well-being of the principal social groups and the government's response to the profound problems that have arisen.

Mexican Reforms

The thoroughgoing package of economic and political reforms implemented during the 1980s created the conditions for Mexico's full integration into the world economy. Its accession to the General Agreement on Tariffs and Trade (GATT) in 1986 was followed by an accelerated elimination of barriers to foreign commerce, the precipitous negotiation of the North American Free Trade Agreement (NAFTA), and the removal of other deterrents to foreign participation in the reshaping of Mexican society and its economy. The results are evident to all observers, although there are varying interpretations of their significance for individual welfare and the nation's future.

The country's economic structure was modified dramatically. The long-standing programme of import substituting industrialisation supported by a programme of 'stabilising development', was jettisoned. The articulated system of interindustrial relations forged to supply basic consumer needs of a modernising population was dramatically unravelled. Instead, the Mexican government allowed an unrelenting succession of consumer goods imports to flood the market. Apparently, this was meant to purchase political support from various social groups who did not fully understand the programme of international economic integration. Small and intermediate sized firms found themselves unable to compete and even many larger companies were forced to lay off sizeable proportions of their labour force as part of their desperate struggle to become more competitive. In the process, export-oriented production reshaped the economy and even the spatial organisation of society.

This neoliberal reorganisation was implemented by a new group of policy-makers. Their vision of the state's role in society led to a profound realignment of economic power, with private interests assuming responsibility for guiding the modernisation and evolution of the productive structure. In the new scheme of things, the professional managers were charged with creating an environment conducive to the smooth functioning of private capital, be it domestic or foreign. Mexico was integrating itself into the world economy more rapidly and completely than other countries, and was offering its rich array of natural resources, be they animal, vegetable or mineral, and its abundant supply of labour power, as inputs to attract the world's corporations who would accelerate the rate of economic growth.

Without evaluating the merits and effectiveness of this strategy, it is clear that it brought about an intense process of social polarisation in Mexico, as elsewhere. This is evident from a summary examination of: (1) the evolution of the labour force and salaries, (2) data about income distribution, and (3) other indicators of material well-being.

Employment and wages: The 1982 crisis ushered in a recession that had disastrous consequences and was further compounded by the sudden removal of import barriers that permitted a massive inflow of consumer goods. When combined with policies that forced peasant communities to abandon the planting of basic crops and the expansion of irrigated and mechanised production, the country faced a massive displacement of labour in traditional jobs. The manufacturing sector witnessed a 22 per cent decline in its share of the labour force in private establishments from 1980 to 1993 [Rendon and Salas 1996] while real incomes in the peasant farming sector fell without a concomitant decline in the labour force [Lopez and Mendez 1992]. The expansion of the 'maquiladora' industry to more than one million employees in 1998 only partially compensated for the slow growth in industry and agriculture. The automobile industry also expanded rapidly. Employing about 1,50,000 people by the end of the 1990s, it responded positively to the withdrawal of import barriers on parts sent merely for assembly. By 1993, before the most recent increase the 'maquila', however, the export platform had jumped from 6 to 20 per cent of the manufacturing labour force. Unfortunately, the expansion in these sectors cannot have the same multiplier effects as the jobs that were lost elsewhere, since purchases of inputs for the maquila are only about 2 per cent of the value of production, and the auto industry is actually running a balance of trade deficit because of the high proportion of imported parts in its products. Further compounding the problem was the wholesale destruction of small and medium-sized business, either because of massive imports with which they were unable to compete, or the lack of credit and the high financial costs for those who were able to obtain financing.

The policies adopted to implement the new vision depressed real wages: an innovative series of wage repression schemes, more recently institutionalised in the form of 'pactos', or tripartite 'agreements' guided the evolution of wages throughout the economy. Because of the lack of long-term aggregate series of reliable information about real earnings, a number of scholars offer their own versions of the misfortune imposed upon Mexico's workers and their families. Since its peak in 1976, for example, the minimum wage has fallen 73 per cent to a historic low of 34 pesos a day (US $ 3.40),

about two-thirds of the level when the concept was first introduced in 1934 [Barkin 1990; Valle and Martinez 1996]. Today it is so low as to be an irrelevant reference point, except for wages paid to day labourers of indigenous origin in agricultural regions, or in some of the maquiladora plants that are moving to Mexican villages far from the border to escape the increasing vigilance of regulatory authorities and militancy of workers' organisations.

Of course, most Mexican families could not survive such a drop in real incomes. Industrial incomes did not decline as drastically: workers' real salaries fell 'only' 51 per cent, while employee wages were squeezed 27 per cent between 1976 and 1996 [Valle and Martinez 1996]. To offset these dramatic changes in pay scales, households throughout the social scale have adjusted by increasing the number of members they send into the labour force, even if this means bloating the ranks of the itinerant merchants and other poorly paid groups. The number of small (micro) businesses has virtually exploded as people desperately search for new ways to eke out a living.[1] In an attempt to draw a coherent aggregate picture of these developments, another scholar developed a measure of 'disposable income per male adult equivalent' for the 1981-96 period. His original calculation of a decline of 22 per cent rose to 30 per cent when adjusted for the dramatic deterioration in income distribution since implementation of neoliberal policies of economic adjustment and restructuring [Boltvinik 1998].[2]

Income distribution: Mexico's inequitable income distribution has provided fodder for ridicule and concern for decades, since the first studies of the issue in the sixties [Martinez 1960, 1970; Tello 1971]. The continuing improvement in material conditions and real incomes undoubtedly explained why, in the midst of increasing concentration of income and wealth through the sixties, the Mexican people continued to support the regime and its model of 'stabilising growth' [Barkin 1974]. But with the end of generalised improvements in economic welfare in the 1970s, and a renewed increase in income concentration, the issue of social polarisation emerged, as did programmes to combat marginality and extreme poverty.

Again, the paucity of reliable information led to creative attempts to describe the process. The offerings range from the pedestrian displays of monetary income by deciles to complex calculations of material well-being on the basis of imputed incomes from owner occupied housing and household consumption of subsistence products and services; summary indices, like the Gini coefficient could hardly do justice to the depths of the polarisation process.[3] The data were never able to encompass the profound differences of a divided, regionally and ethnically segregated, occupationally segmented society. Regardless of how it was measured, however, the distribution became more unequal, accelerating with the neoliberal approach to economic management.

The differences within the working classes are, themselves, quite striking. In 1997, with about 20 per cent of the working population earning less than one minimum salary and another 15 per cent with no income at all, the workers covered by industrywide union contracts averaged 1.8 minimum salaries, manufacturing workers 4.6, construction workers 2.6, while the maquila workers averaged 3.1. Similarly, the president reported in his 1998 state of the union message that while average real wages for workers covered by the social security system (IMSS) declined by 24 per cent in real terms between 1994 and 1997, particular industry groups experienced losses ranging from 18 per cent to 41 per cent, with the least harmed being concentrated in the larger enterprises [Rendon 1999]. Clearly, recent employment trends, concentrating growth in the service sector's smaller firms, only serve to heighten polarisation.

Material well-being: A brief glimpse of the magnitude of poverty is sufficient to reveal the depth of the problems facing Mexico today. The stage of stabilising development (1958-70), now discredited for its inward looking approach, culminated a 35 year 'miracle' of high rates of economic growth and contributed to forging the industrial labour force and middle classes. Using a composite measure of basic needs and a socially defined poverty limit, the fraction classified as poor fell from more than three-quarters of the population in 1963 to less than one-half in 1981, a glowing testimony to the efficacy of import substitution in addressing some of Mexico's pressing social problems [Hernandez Laos 1992]. In contrast, with the implementation of the neoliberal approach to macro-economic management following the crisis of 1982, the same methodology produces an alarming 30 per cent increase in the magnitude of poverty by 1994, before the onset of the most recent economic crisis [Boltvinik 1998].

Official Welfare Programmes

In the face of these growing inequalities, the government developed a succession of welfare programmes to contain the diverse manifestations of social discontent. Unlike past epochs, however, when profligate public expenditures were used as a tool of social control and redistribution, the new budgetary discipline has forced a profound change in the way the government responds to righteous demands from the growing ranks of the extremely poor.

One-quarter century ago, the government created a Commission for the Marginal Areas to signal its awareness of the problem. By creating community level organisations, it offered to provide support for micro-businesses, attack the problem of rural unemployment with an infrastructure construction programme, and broaden the options for consumers and producers alike by subsidising local co-operatives or privately owned stores. Like other such programmes that would be implemented during the following decades all over Mexico, they proved ineffective in stemming the increase in poverty. Rather than breaking down structural barriers, most analysts agree that they maintained the poor 'in their place', enlisting them for the political machine that guaranteed electoral victories for the official party or occasionally for the opposition [Fox 1992; Fox and Moguel 1995; Haber 1992]. Regardless of the explanations for these failures, there is general agreement that they were expensive and generally ill-conceived mechanisms for attacking the root causes of poverty.

Today the watchword of social welfare programmes is 'targeting'. Previously, as a last fling to build or reinforce a political constituency among the poor, the PRI integrated a highly visible programme of public works, social services, and political mobilisations. Tried under the flag of 'Solidarity' during the Salinas de Gortari administration, it was judged a failure after its director, Luis Donaldo Colosio emerged as the new presidential candidate and was assassinated. The panoply of subsidies and the institutional safety net for urban poor and peasants is now replaced by a succession of programmes designed to reach the most vociferous of the poor or those who might favourably respond to these manifestations of public sector concern.

The new approach, dictated by the dual imperatives of fiscal responsibility and use of market guidelines, confers greater responsibilities on the poor. As in other

countries that have adopted the neoliberal model, the poor are no longer considered to be passive victims of the system, to be extracted from their plight by a generous programme of public expenditures. There is widespread agreement that this approach simply will not work. The government now conceives its responsibility as identifying the poor as precisely as possible and offering succour so that they can strive as individuals to resolve their particular problems and (re)join society.

To implement this approach, new domestic programmes have been designed to reinforce international commitments to facilitate the unfettered operation of global markets. In rural areas, price supports were rapidly withdrawn (except for a temporary extension in the case of corn and beans[4]) to allow producers freer reign in making decisions about how best to raise output. In their place direct payments are now made to farmers (ProCampo) in recognition of their need for income supplements because of the prevailing low levels of productivity and farmgate prices. Few remember that this change from crop to income supports was a commitment made during the NAFTA and the Uruguay Round of trade negotiations. Similarly, the aid and public works approach to poverty reduction is now being replaced by direct payments to needy families with young children. The services supplied through the PROGRESA label of modern social welfare to a well-defined clientele are expected to reinforce their own desire and ability to 'invest in human capital' and thus create a new productive labour force for the future. With these innovations, poor people are now receiving direct payments from the government in the form of cheques that they can cash to truly modernise their poverty and their relationship to the bureaucracy of poverty. No matter that the political machine that oversees the programmes' implementation has changed little and oft times delays the distribution of these cheques until just before crucial political contests or mobilisations.

The new welfare system is founded on the same premises as those guiding the economy as a whole. If markets are freed from the institutional fetters that limit individual creativity and initiatives, then production will increase more rapidly and specialisation will promote a generalised improvement in welfare through global exchange. Similarly, if individuals are given the wherewithal to realise their full potential, then they too will succeed in pulling themselves up from poverty much more effectively than any official anti-poverty programme might. Both sets of assumptions are based on the vision of competitive markets offering equal opportunities and similar market power to all participants. With unimpeded capital flows and limited labour mobility, however, the pervasive inequalities that have deepened social chasms in Mexico can only become even more severe; it will become increasingly difficult to create opportunities for the poor to surmount the heritage of institutional and cultural obstacles or for small- and medium-sized businesses to create the goods and services that will generate the jobs required for further growth.

A new welfare programme cannot hope to compensate for the profound failings of the productive model. As long as public policy is designed to give free rein to international capital flows and disparage the importance of consolidating an integrated productive structure at home, it is unlikely that Mexico will be able to generate the productive jobs and public resources that it needs to rebuild its economy and strengthen its society. The individualisation of poverty, through the modernised welfare system further complicates the task, dividing communities against themselves, as each person struggles in the hope of qualifying for the new cash payments and political favours. Even more troublesome, by attempting to break down the traditional ties of community governance and collective process of resource and ecosystem management, the structural adjustments of neoliberal production and social polarisation threaten the ability of the system to contain social discontent within bounds and to guarantee the planet's ability to support human society.

An Alternative Vision

Ironically, even former president Salinas de Gortari now claims to understand this reality. After forging the institutions that plunged Mexico into the morass in which it presently finds itself, he now claims that "we need to fashion...a decentralised and participatory alliance between public actions and private initiative". Recognising that "the neoliberal version of the market economy may favour the interests of big international businesses and transactions" the erstwhile autocrat now recants, calling for a "deepening of democracy...an economy more open to diversity of practices and institutions...and, therefore better able to combine the two clashing and overlapping requirements of economic progress – co-operation and innovation" [Salinas de Gortari and Mangabeira 1999]. This apparent rebuke of the new generation of blind apostles of the neoliberal catechism by the demigods of yesteryear serves as fair warning: we must be ever more vigilant and steadfast in our defence of the fundamental values on which human society depends for its cohesion and on which the planet Earth depends in order to continue to sustain us.

Fortunately, many sensible and dedicated people in Mexico and elsewhere are actively resisting their incorporation into this neoliberal pattern of global integration. In today's world, it makes little sense for peasant communities to insist on struggling to eke out an existence. The logic of the market modernisers would 'reassign' these large segments of the population to more socially desirable locations through the seemingly 'neutral' workings of the marketplace. Instead, as much as one-third of Mexico's population has chosen to attempt to shape an alternative route. These people are not the isolated country bumpkins of yesteryear; rather they are members of societies that have become quite socially adept at maintaining some degree of independence: they survive under conditions that are often described as being 'infrahuman,' managing a complex array of resources, crossing frontiers as others might navigate a high-speed thoroughfare, negotiating in hostile institutional settings to find employment, transferring funds and then often choosing to return to their 'backward' communities. They clearly are trying to implement their own plan for the future: every year they transfer from other parts of Mexico and from the US resources equivalent to more than 40 per cent of the value of rural production. It is incumbent upon us to determine whether their alternative vision might not offer better opportunities for us all, including those of us locked within the confines of the modern, global economy [Barkin 1998a, 1998b].

For those of us committed to the construction of an alternative model, responding to the demands of the majority and the needs of the earth, the neoliberal prescriptions to macro-economic management only make our task more difficult. With a rich heritage of experiences from people around the world, it is possible to forge constructive responses that will improve the lot of those who are presently excluded, while improving conditions for many others who are now suffering the terrible consequences of globalisation: declining real wages and a deteriorating quality of life. We will be on much more solid footing by casting our lot with those who have steadfastly re-

sisted the drive towards globalisation, than by responding to the siren calls of latter day repentants.

Notes

1 They increased at a rate of 11 per cent a year between 1988 and 1993, accounting for 50 per cent of the increase in employment in fixed establishments, according to the economic censuses [Rendon 1999]. The author goes on to point out, on the basis of the National Employment Surveys, that 70 per cent of these workers are not salaried and accounted for 42 per cent of all the labour force in urban areas with more than 1,00,000 people in 1996.

2 This work is one product of a collaboration with M Desai and A K Sen (1992) to develop an 'Index of Social Progress' to measure the magnitude of the basket of opportunities available to the Mexican people.

3 The sizeable decline in the Gini coefficient from 0.5137 in 1994 to 0.4885 in 1996 illustrates the complexity of these measurement problems. Real monetary incomes declined sharply during the period for *all* income groups, including the so-called middle classes and the self-employed, as well as the very rich; as a result, the apparent reduction in inequality was the result of a larger decline in the incomes of the wealthy than an increase in the incomes of the poor In the process, the 1996 household survey revealed that *every* income group spent more than it received that year, in contrast to the findings from 1992, when only the poorest 60 per cent of the population overspent [Romano 1996, cited in Rendon 1999].

4 Even these payments are being abruptly truncated, as Nadal (1999) documents quite forcefully in his analysis of the environmental impacts of corn production under the NAFTA.

American Communalism and Indian Secularism

Religion and Politics in India and the West

Robin Archer

Much of the Indian debate on secularism is built around what seem to be the common sense assumptions about India and the west. But a close look at the impact of Protestant Puritanism on the relationship between religion and politics in the US suggests that these assumptions are mistaken. Far from having fundamentally different experiences, there are some striking similarities between India and the US: similarities which draw attention to potential long-term dangers for India.

IN this paper I want to make a contribution to the debate on secularism and communalism which has been at the centre of Indian intellectual and political life for more than a decade. My starting point is the observation that, either explicitly or implicitly, many of the participants in this debate make use of a comparative framework which rests on certain apparently uncontroversial assumptions about India and the 'west'. In particular it is assumed (1) that western societies share common beliefs about the appropriate relationship between religion and politics and that these beliefs have been institutionalised in common secular practices; and (2) that the fate of secularism in India (and even the question of whether or not it is desirable) is best understood by highlighting fundamental differences in the relationship between religion and politics in Indian and western societies. I want to suggest that each of these assumptions is mistaken.

These assumptions take a variety of more specific forms, but they are widely made by both opponents and proponents of secularism. However, they play a particularly prominent role in the work of 'anti-secularists' like T N Madan and Ashis Nandy, who have been at the centre of much of the recent debate. And so, at certain points, my argument will focus more specifically on their work.

Secularism in the West

Let me begin with the first assumption, according to which a common set of secular beliefs and practices govern the relationship between religion and politics in the west. In fact, whatever other commonalities these societies may have, in this respect, they are marked by extraordinary diversity. Even if we look only at one small subset of western societies – those rooted in English cultural, political and economic traditions – we find a full range of possible outcomes. The US has a secular state, but not a secularised society. Britain has a secularised society, but not a secular state. And only Australia has both a secular state and a secularised society. Moreover, even where similar outcomes have been achieved in different western societies, these outcomes have often been reached by very different paths. Both the US and France have established secular states. But, in France, this was achieved by mobilising militant anti-religious movements, while, in the US, it was achieved without any such mobilisation. Likewise, both Britain and France have largely secularised societies. But, in France, secularisation was accompanied by massive conflicts between church and state, while in Britain, such conflicts were limited.

The case of the US is especially interesting. For there, as in India, we can study what happens when a formally secular state presides over a deeply religious society: a society from which religious issues continually emerge and seek to force themselves into the political arena. Many of the major political conflicts which have shaped the US can only be understood once they are viewed in this light: the abolitionist struggle against slavery in the mid-19th century, the prohibitionist struggle against the production and consumption of alcohol in the late 19th and early 20th centuries, the anti-abortion crusade since the sixties, and even (though it is hardly in the same league) the struggle over the president's sexual morality today. These were not the only important conflicts in American hisotry, but they were all defining conflicts that absorbed the energy and ingenuity of millions of activists and voters, and played a key role in defining their political loyalties. As we will see, each is a manifestation of a recurring struggle between the inheritors of a Puritan Protestant tradition, which seeks to ensure that the state uses its authority to make of the US a Godly society, and a 'secular' coalition, that rejects any government activity which seeks to promote a particular version of godliness.

The US is also especially interesting because it was there that the concept of religious 'fundamentalism' was invented. It was first used in the 1920s, not to refer to Islamic, Hindu or other foreign zealots, but to refer the home grown evangelical zealots, who were fighting secular humanism in all its forms, and especially in the classroom, where a mass movement of 'fundamentalists' sought to ban Darwinian theories and replace them with the teaching of 'creation science' based on the 'historical truth' revealed in the *Bible*. Indeed the term 'fundamentalist' was invented by these zealots to describe themselves [Marsden 1991].

Finally, the US is especially interesting because, in the literature on Indian secularism, it has frequently been treated as the paradigm case of a 'western' society, and as the paradigm embodiment of 'modernity'. Consequently, it has, from the beginning, been used as the benchmark for judging the extent to which independent India really is secular, and for assessing whether or not the establishment of a fully secular state is either possible or desirable in Indian conditions [Smith 1963:8, Luthera 1964:11-13].

Puritan Legacy in the US

In what follows, then, I want to focus on the US. I want to start by using the US case to consider some of the more specific claims which have been used to underpin the assumption that there has been a common western experience in matters pertaining to secularism. This assumption is often justified by referring to ideological or intellectual developments which are said to be common to the west. In particular, a common western experience in matters pertaining to secularism is said to stem

from either the Protestant Reformation, or the Enlightenment, or both [Madan 1997:275-76, Madan 1998:298,319 and Nandy 1998:325].

The US case presents a number of problems for this thesis. Although it has been usual, especially in the middle of the 20th century, to view the US as having been born liberal [Hartz 1955], the colonies which formed it were in fact founded well before the eighteenth century European Enlightenment. As a result, some of the basic enduring features of the political culture of the US were formed under the influence of pre-Enlightenment doctrines. It is certainly true, however, that, first and foremost among these, was a particular brand of Protestantism.

The settlers who established the northern colonies of New England in the 1630s, were religious radicals, who, when they seemed unable to prevail in England itself, sought to establish a new, model righteous society in America, based firmly on the principles of Puritan Protestantism. But their Protestantism was in no way conducive to secularism, or even to the tolerance of religious dissent. On the contrary, the founders of New England colonies like Massachusetts were the Ayatollah Khomeneis of the early 17th century.

What was the system of government, and what was the relationship between religion and politics, in the societies which the Puritans founded? The Puritan state was a minority 'dictatorship of the holy' [Miller 1956a]. The Puritans believed in predestination – that God had already chosen those that would be saved. Those so chosen would know who they were because they would have a personal religious experience, and only those who could publicly attest to having such an experience – never more than about one-fifth of the population – could be full members of the official 'Congregational' church and hence of the state, and only they could elect their religious and political rulers.

However, these rulers were not to act according to the wishes of those who elected them, but, rather, in accordance with the will of God, which, for most purposes, was thought to be revealed in the *Bible*. There were, of course, a number of disputes about just what an orthodox interpretation of the *Bible* revealed, but all agreed that orthodox represented the truth, from which no dissent could be allowed. Proponents of dissent were fined, whipped, exiled, and eventually, if they persisted, hanged. In short, the Puritan state was not just a dictatorship; it was an authoritarian theocracy.

The idea that there should be a separation of church and state was completely alien to the Puritan tradition. On the contrary, the unity of religion and politics was axiomatic, indeed it was central to the very rationale for founding these new societies.

Though New England was the centre of American intellectual life, and the ideas developed there had an enduring impact on subsequent American thought, not all the colonies which later established the US were founded on Puritan principles. Southern colonies like Virginia were also hostile to any separation of church and state, but there it was the Anglican church (i e, the Church of England) that was established as the official state church. In the mid-Atlantic colonies, however, there was no established religion, in part, as in New York, because the proponents of establishment were divided over which church to establish, and in part, as in Pennsylvania, because of the influence of Quakers, who, unlike the Puritans and Anglicans, were doctrinally committed to toleration. These exceptions aside, for a century or more, most American colonies, whether in the north or south, actually reduced the small amount of religious freedom that was then available in England [Murrin 1990].

How then, did the US, come to have a secular constitution which institutionalised the separation of religion and politics? Three developments were important: the two 'Great Awakenings', and the revolution.

The two Great Awakenings were mass Protestant revival movements in which highly-emotional waves of religious frenzy, promoted by charismatic and often uneducated itinerant preachers, swept through the country. The first Great Awakening took place in the 1740s. The second rolled on through the first half of the 1800s. These movements altered the religious geography of the US. They democratised the Puritan legacy, and spread it throughout the country, in a new pietistic and evangelical form [Miller 1956b, Murrin 1990, Hatch 1990]. The new pietistic and evangelical movements rejected the restrictive Puritan prescriptions that limited those chosen by God to an elite minority, and, instead, made the kind of personal religious experience which Puritanism called for, easily available to all: indeed, in the name of God, they demanded it of all. But they simultaneously carried forward the Puritan idea that the *Bible* revealed the will of God, and that government should act to reorganise society in accordance with that will. This combination of ideas proved to be a powerful mix, and it has remained a central element of American culture to this day. Ideologically, then, the Great Awakenings were conducive to democracy. They were not, however, conducive to secularism.

But the Great Awakenings also had another effect. For they left in their wake a multiplicity of sects and denominations and an inescapble religious pluralism: not just between the various colonies, but also with them, as Methodists, Baptists, Presbyterians and others, split or displaced the previously dominant (Puritan) Congregationalists, Anglicans and Quakers [Murrin 1990:25-26]. This made it increasingly difficult for colonies (and later states) to sustain official preference for any one church. By 1833, even the Puritan redoubt of Massachusetts had disestablished its official Congregational Church.

The emergence of an inescapable religious pluralism also had a decisive influence both on the framing of the new federal constitution of the US in the 1780s, and on the first amendment, passed soon afterwards, which stipulated that "Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof". Here we begin to see Englightenment ideas influencing American political thought. But while key individuals like Thomas Jefferson and James Madison were personally influenced by these ideas, it was not their personal preferences that were principally responsible for establishing what Jefferson later described as "a wall of separation between church and state" [Murrin 1990:29, Pole 1978:58, 1993:92]. For as we have seen, most Americans, whether adherents of the old Protestant churches or the new evangelical-pietistic ones, belonged to traditions that were, in principle, against such a separation. Rather, there were two other factors which were crucial to the emergence of a secular constitution.

First, faced with a multiplicity of competing religious organisations, many denominations and sects were now more concerned that the authority of the state might fall into hostile hands, than they were with the unlikely prospect that they could acquire exclusive control of it for themselves. A unified regime of church and state, which ensured that the whole community would live a more Godly life, was still considered optimal, but, if that were now impossible, a neutral state, that enabled one to live a Godly life oneself, was the next best thing, far better than being forced to live according to the edicts of some other religious group [Pole 1993].[1]

Second, the framers of the constitution saw, that given the passions which religion aroused, it would have to be excluded from the political arena, if their nation-building project were to stand any chance of success. By promising to keep the federal government out of religious affairs, the states would be free to retain their own institutional arrangements: those that favoured establishment could retain that arrangement, as could those that favoured political neutrality towards different churches. Only under these circumstances would all states be likely to ratify the proposed constitution [Howe 1965: 19-23, Wilson 1990].

In short, the US adopted a secular constitution "not because religion was unimportant to the colonists, but rather because it was too important" [Marsden 1991: 86]. Those, like Jefferson and Madison, who were influenced by Enlightenment ideas, supported the separation of religion and politics for fear that religion would corrupt politics. But a far more widespread reason for supporting this separation was the evangelical fear that politics would corrupt religion [Howe 1965: 5-8].

Let me spell out two conclusions which emerge from this discussion.

First, the anti-secularists (along with many other contributors to the Indian debate) make the specific claim that western secularism emerged as a result of either the Protestant Reformation, or the Enlightenment, or both. But the establishment of a secular constitution in the US does not bear this out. A particular brand of Protestant ideology was indeed a strong influence, but it did not favour secularism. Enlightenment ideology did favour secularism, but key elements of American political culture emerged before its influence was felt, and when that influence was felt, it was largely restricted to a section of the revolutionary elite.

Second, the specific importance claimed for Protestantism and the Enlightenment is embedded in a more general claim: namely, that the values embedded in the dominant ideological or intellectual traditions of society, play an important role in explaining whether or not secularism can emerge and sustain itself. Thus, according to Madan (1997:261), "what exists empirically, but not ideologically, exists but weakly". The US case shows that this, too, is misleading. Whatever their role in other western countries, it was not ideological traditions that gave rise to secular institutions in the US, and even less was it the classical commitments of high theological thought, as Madan (1998:303-7) seems to suggest. Of greater importance were more prosaic and pragmatic considerations, like the desire of sects and denominations to protect their separate organisations, and the need to maintain a consensus if the nation-building efforts, to which political elites gave priority, were to succeed. The political attitudes of religious groups are profoundly affected by the context in which they find themselves.[2] For many Protestant sects and denominations in the US, the need to coexist with a number of well-supported competitors, came to outweigh purely ideological considerations.

A False Emphasis on Differences

Let me turn now to the second assumption which is present in much of the literature on secularism. According to this assumption, the prospects for secularism (and even its desirability) can be best understood by highlighting fundamental differences in the relationship between religion and politics in India and the west.

But, at least with respect to the US, many of the differences that have been highlighted, either do not exist, or do not help to explain the development of secularism. A hierarchy of increasingly specific characteristics have been identified as constituting the key differences between India and the west.

First, it is said that India is different because the secularisation of society has been very limited, and secularisation must be widespread if a secular state is to survive and prosper [Madan 1998:298]. But we have seen that the society over which the (atypically) Enlightenment-influenced Jefferson presided, was every bit as deeply religious as the society presided over by the (atypically) Enlightenment-influenced Nehru. Jefferson was, in a sense, a kind of American Nehru: influenced by the emerging thought of the French revolution, just as Nehru was by the emerging thought of English socialism. If Nehru's secular constitution 'imposed' Enlightenment values on a religious society in India, Jefferson's did so no less in the US.

Second, even if secularisation is also limited in the US, it is said that India is different because of the particular kinds of religious belief that dominate there. In particular, intellectual traditions in the US were suffused with Protestant Christianity, which is said to be the only religious tradition conducive to secularism. Indeed, according to some, secularism was a 'gift of Christianity' [Nandy 1998:325, Madan 1998:298, 319]. But we have seen that, though Protestant beliefs do indeed course through the veins of the American body politic, this tradition was far from conducive to secularism.

Third, even if Protestantism itself is irrelevant, it is said that India is different because classical Indian religious thought posits a "hierarchical relationship" in which politics is subordinated to religion [Madan 1998:303-7], and that Indians themselves have a 'totalising' religious worldview which makes it both undesirable and impossible for them to separate political from religious questions [Madan 1997:209 and n3 and 1998:302, 318]. But we have seen that a similar hierarchy is posited by classical Puritan religious thought, and that this also fostered a 'totalising' worldview: one which "penetrates all partial and fragmentary worlds in which men participate" [Kleppner 1979:183-85], and in which "the unity of religion and politics was so axiomatic that very few men would even have grasped the idea that church and state could be distinct" [Miller 1956a: 142-43, 148, Swierenga 1990: 150-51].

Some Important Similarities

Here, however, I want to take the argument one step further. I want, not only to dispute the relevance of the differences which others have highlighted, but also to make the stronger claim that there are actually striking similarities between India and the US. More particularly, I want to highlight similarities between contemporary India, and the US in the second half of the 19th century. I want to suggest that consideration of these similarities might help to clarify some of the possible consequences of contemporary Indian developments. I do this somewhat tentatively – conscious of the scepticism which such a claim is likely to invoke. But at the very least I hope to convince you that a different kind of comparison with the US may be worth exploring further.

There are a number of general structural similarities which contemporary India shares with the US in the mid-19th century. Both are continent-wide societies, with a predominantly rural population, a largely agrarian economy, a British legal system, a federal polity, a well-entrenched democracy, and a first-past-the-post electoral system. There are also similarities between the American party system that emerged in the mid-nineteenth century, and the party system that now seems to be emerging in India. It is these similarities which I want to discuss here.

The electoral history of the US is punctuated by intense periods of 'realignment' in which the social bases of party support, and the issues around which

political conflict is centred, are redefined. These periods are followed by longer periods in which a new party system, based on the new alignments that have emerged, and the party loyalties which they generate, is frozen in place – or, rather, becomes relatively immutable – for several decades.

Here I want to focus on the 'third party system', which emerged in the 1850s, from the developments that led to the American Civil War, and lasted until the depression of the 1890s. Prior to the Civil War the Democratic Party – the party of Jefferson – was the dominant force in federal politics. Its dominant position had been strongly reinforced by reforms it initiated in the 1820s and 1830s, which, amongst other things, removed the remaining property qualifications on white male voters. The realignment of the 1850s ended the dominance of the Democrats and lead to the birth of a powerful new opponent – the Republican Party.

The most important component of the new Republican Party were the pietistic and evangelical movements which grew out of the religious revival of the Second Great Awakening. As we have seen, these inheritors of the Puritan tradition had accepted the formal separation of church and state, but they remained committed to the task of moral regeneration and of establishing of Godly society in America. All around them they saw terrible sins, and, irrespective of their differing sectarian and denominational affiliations, they rallied together to force the government to use its authority to uphold their notion of righteousness, and to enforce what they deemed to be a Godly way of life. These neo-Puritan social movements demanded that the government act to end a wide range of sinful practices in saloons, schools, in the desecration of the sabbath and elsewhere, but more than anything else they demanded an end to the truly abominable sin of slavery.

A second important component of the new Republican Party were anti-Catholic nativist movements (like the 'Know-Nothings'), which grew out of a backlash against mass (especially Irish) immigration, following the European famines of the 1840s. These nativist movements – 'nativist' in the sense that they were movements of those who were born in the US – party overlapped with the pietistic and evangelical movements. To the sectarian Protestant imagination (as indeed to many liberal humanists), Catholicism was not just another Christian denomination, it was an international, authoritarian conspiracy – perhaps even the work of the anti-Christ – which posed a threat to the America's culture and values not unlike that which Communism was deemed to pose in the twentieth century.

These two groups of movements – the pietistic movements for the abolition of slavery, saloons and other sins, and the anti-Catholic nativist movements – joined with a third component – the remains of what had, until then, been the main opposition Whig Party – found the Republican Party and dominate federal politics.

Those who rejected the call for government intervention to uphold the cultural norms of particular religious and ethnic groups, coalesced around the Democratic Party. In the process they strengthened the salience of its identity as the party of secularism and (European) ethnic diversity. To Catholics and non-pietistic Protestants in the north, the core Democratic message was that it is not for the government to decide whether drinking alcohol, and various other social and religious practices, are immoral. Let each community follow its own values and its own values and its own way of life. Strange though it now sounds, the core Democratic message to the south was similar. It is not, they said, for the government to decide whether or not slavery (or, later, segregation) is immoral. Let each community follow its own values and its own way of life. Thus, in both the north and the south, the Democrats represented themselves as the party of 'personal liberty', and of cultural and religious *laissez-faire*. Their opponents characterised them as the party of 'Rum, Romanism and Rebellion'.

The Democratic Party was not 'secular' in the (French) sense that its supporters were hostile to institutionalised religion. On the contrary they were typically members of 'liturgical' religious communities, which placed special value on the formal ritual practices of hierarchically-organised churches. They thus rejected pietistic beliefs, which deprecated ritual and instead emphasised each individual's personal conversion experience, their personal moral behaviour, and their personal relationship with God. Catholics were paradigmatically liturgical, but so too were many Protestants, notably Anglicans and German Lutherans. These differences between liturgicals and pietists fed into different attitudes towards politics. Liturgical churches believed that it was not for humans to foreshadow the work of God, by trying to create a kingdom of righteousness on earth. For this reason they were suspicious of pietistic efforts, which they tended to view as fanatical, and they were especially resistant to efforts to draw the state into pietistic moral crusades, since this challenged the paramountcy of the moral authority, which they claimed for themselves, and sought to impose on their members. It was in this sense that the Democratic Party and its supporters were secular. The upheld the belief that the state should remain neutral in matters of religion, lifestyle and personal morality.

The result of the realignment of the 1850s, was a party system in which each of the two main parties became a kind of 'political church'. This does not mean that they represented any particular sect or denomination. On the contrary, both were composed of a complex coalition of different social groups, each defined, in part by ethnic origin (native, German, Irish, Swedish, etc), and in part by religious affiliation (Methodist, Baptist, Anglican, Catholic, etc). Rather, the parties were political churches in the sense that they represented, and bound together, two distinct ethno-religious subcultures: a pietistic one represented by the Republicans, and a secular one represented by the Democrats. For most Americans, the act of voting was an expression of their identification with one or the other of these two subcultures.[3]

Here is a party system that looks similar to that which is emerging in contemporary India. During a decade of realignment, the old Congress-dominated party system has been displaced, and, as in similar periods in the US, there have been a number of short-lived 'third party' successes. Now, however, the outcome of this process of realignment is becoming clearer. Responding to the incentives generated by the first-past-the-post electoral system, political forces are coalescing around two main parties. In their ideology, social base, and organisational infrastructure, these two parties share important similarities with the Republicans and the Democrats in the second half of the 19th century.

The BJP, like the Republicans, has established itself as a 'communal' party of religious revival and assertion. And, like the Republicans, it has a social base in the dominant religious community (which in each case is organisationally and ideologically disparate), and an organisational infrastructure linked to highly-motivated extra-parliamentary mass movements. The (new, realigned) Congress, like the Democrats, is seeking to re-establish its credentials a 'secular' party of resistance to religious assertion. And, like the Democrats, it has a heterogeneous social base among groups, both inside and outside the majority community, which

reject the political demands of revivalism, and an organisational infrastructure based on political patronage: a legacy of its previously dominant position.

As a result, the issues which provide the defining conflict of both party systems are also similar. In each case, this conflict concerns whether or not the state should promote the values, practices and symbols of the dominant religious tradition. Like the Republicans, the BJP is committed to a programme of cultural homogenisation, through state enforcement of particular religious and moral norms. Like the Democrats, the Congress is recommitting itself to the defence of cultural diversity, through the maintenance of state neutrality in questions of religious and personal morality. Even many of the specific issues through which this defining conflict is expressed are similar. Mobilisation against the largest religious minority, their supposed foreign loyalties (Muslims to Pakistan, Catholics to Rome), prohibition of alcohol, support for schools run by minority communities, the spread of foreign languages, sexual morality, and the use of sacred texts in public schools: all are among the issues which generate the most passionate disputes in both cases.

In both cases the social tensions which these conflicts foster, result in recurrent outbreaks of communal violence, in which lives are lost, homes and places of worship are attacked, and the neutrality of the police is called into question. In the US, prior to the upsurge in labour unrest in the late 19th century, the suppression of ethno-religious riots was the major peace-time activity of the armed forces [Reinders 1977].[4]

Long-Term Dangers

What insights does this comparison provide for those seeking, either to influence future developments in India, or to understand their likely course? A few simple points are worth emphasising.

First, the fear that the establishment and maintenance of a secular state will necessarily weaken religious beliefs and institutions, and the charge that pro-secular attitudes are necessarily anti-religious, are both completely misplaced. In the US, a long line of distinguished sociologists, from Tocqueville (1969) to Lipset (1996), have observed that quite the reverse is true. The long separation of religion and politics has fostered a continual process of renewal, which has enabled religious institutions and beliefs to flourish to an exceptional extent.

Second, comparison with the US raises important questions about what criterion should be used for judging whether or not secularism has been successfully institutionalised. If religious activism in politics is seen as evidence that secularism has failed in India, then secularism must also be judged to have failed in the US.

Third, comparison with the US highlights the importance of disaggregating categories like Protestantism and Hinduism, if an adequate understanding of the political impact of religion is to be reached. Clearly caste communities frequently have radically different political loyalties. But it would also be interesting to explore whether Hindus committed to Bhakti and other 'personalist' traditions, have different political loyalties to Hindus committed to more 'ritualist' traditions, just as pietistic and liturgical Protestants have different loyalties in the US.

Here however I am more concerned to draw attention to some other, potential long-term consequences of current developments in India. The similarities between the party system now emerging in India and the American party system of the second half of the 19th century, suggest that consideration of the subsequent history of the US may help to clarify some of these potential long-term consequences. Let me make it clear that I am not pursuing this comparison in the spirit of those American political scientists in the fifties, who sought to highlight the virtues of their system, and urged all and sundry to emulate it. Rather the comparison I am pursuing is more in the nature of a warning: a warning about some of the potential dangers of the kind of party system which is currently emerging in India.

In no democracy is the party system a simple reflection of the multiple interests and issues which are present in that society. For the party system also helps to pick out and strengthen the salience of some of these interests and issues, and weaken the salience of others. In short, the party system helps to establish which interests and issues are to be recognised as politically important. By reinforcing the salience of ethno-religious interests, the US party system in the second half of the 19th century undermined the prospect for class politics, by weakening the salience of economic interests and of distributive justice. Voters were, of course, concerned about their economic interests, but, by and large, when they went to the polls, taking their cue from the agenda set by the party system, they voted not for their class, but for their ethno-religious interests.

This is one of the main reasons, why, even in the late 19th and early 20th century, when the US had become one of the leading capitalist economies in the world, it still failed to produce an electorally important labour or socialist party. It also helps to explain why, to this day, the US has weak unions, insecure workers, negligible interest in redistributive policies, and no real welfare state.

Can these outcomes be avoided in India? It hardly needs to be said that no society is destined to simply follow a path already laid down by others. The enduring role of religion in the US is itself evidence of that. But the similarities between the American party system in the second half of the 19th century, and that now emerging in India, should give pause for thought: especially to those motivated by the ideals of the socialist tradition.[5]

Through the first third of the 20th century, when labour and socialist parties became major contenders for government in every advanced capitalist society, in the quintessentially capitalist US, political controversy was focused on issues like the prohibition of alcohol, and on whether to teach Biblical or Darwinian science in schools [Marsden 1991]. Not until a quarter of the labour force was thrown out work in the Great Depression of the thirties, did a social democratic tinge appear in American politics. Roosevelt responded to the depression with his 'New Deal' programme, which repositioned the Democrats as a semi-social Democratic Party, and forced a realignment of the party system. But by the last third of this century, ethno-religious issues had reasserted themselves. The cadres of the Christian coalition are now more important to the Republican Party, than union activists are to the Democrats, and issues like abortion and the sexual behaviour of the president dominate political space.[6]

My argument in this article is informed by a larger concern about the use of all-embracing concepts like 'modernity', and the 'west'. These terms are frequently used to suggest that western societies share a common core of cultural characteristics, one of which is secularism. But in the norms that govern their attitudes to religion and politics, western societies share no such cultural core. In these matters, even a single, paradigm, western society like the US has no common core of cultural norms.

The anti-secularists are right when they say that India has a political culture which is deeply influenced by religious traditions. But they are wrong when they say that India does not have a secular political culture. For, just like the US, it has both. Each country has two powerful political

subcultures, tied together by a mix of ideology and self-interest. One seeks to subvert the religious neutrality of the state. The other seeks to maintain it. In complex democracies like India and the US, political culture is not monochromatic: it is composed of multiple competing traditions, of which these two are the most important.

In both countries there is a constant political struggle to see which of these traditions will prevail. But in both countries there is also a vital, often-ignored, meta-struggle about the salience of these traditions, and about whether or not they should continue to define the main terms of political conflict.

Notes

[I would like to thank Corpus Christi College, Oxford, for sabbatical leave, the Jawaharlal Nehru University for a visiting fellowship, and the Hayter Fund of Oxford University for a research grant. Without the support of these institutions this article could not have been written. I would also especially like to thank Rajeev Bhargava, Ravinder Kumar and Elisabeth Kogler for their help and support.]

1 Madison, for example, appealed to precisely this fear, during the debate on religious freedom in the Virginia legislature: "Who does not see", he argued, "that the same authority which can establish Christianity, in exclusion of all other religions, may establish with the same ease any particular sect of Christians, in exclusion of all the other sects" [Pole 1978:83].

2 The political behaviour of practising Catholics in the 20th century is a particularly striking example of this. Practising Catholics have typically supported right-wing or authoritarian parties in countries like France, Italy and Austria, where nominal Catholics are in an overwhelmihg majority, but in countries like the US, Britain and Australia, where nominal Catholics are in a minority, they have typically supported left-leaning parties.

3 For the most influential treatment of these issues see Kleppner (1970 and 1979) and Jensen (1971). For shorter versions of their arguments see Kleppner (1978 and 1981) and Jensen (1970). For a recent summary of the wider literature see Swierenga (1990).

4 There are many other comparative themes which would be well worth exploring further. Here, however, there is no space to do more than indicate some of the issues that deserve more detailed comparison. These issues include: (1) The role of dalits and blacks: both highly oppressed groups, but within the dominant religion tradition. (2) The similar, vicious charicatures and stereotypes to which adherents of the largest minority traditions – Muslim and Catholic – are subject. Both are deemed to be disloyal, uneducated, fast-breeding, poverty-ridden, potentially authoritarian, voting fodder. (3) The centrality of struggles over education. And (4) political mobilisation in cities like New York and Bombay, where large-scale, ethnically-diverse immigration (whether across land from all the regions of India, or across sea from all the regions of Europe), was met by working class nativist, sons-of-the-soil agitation (whether of the Shiv Sena or the know-nothing variant).

5 Of course there are also important differences between these party systems. Amongst the most important differences in India are the impact of caste and regional politics, the sustained presence of a 'third party' left, and the diffuse ideological influence of the socialist tradition. Whether some combination of factors like these can enable India to avoid an American outcome, would be a worthwhile focus for further comparative inquiry.

6 For the ongoing, and in some respects increasing, importance of religion in contemporary American elections see Kellstedt and Noll (1990) and Miller and Shanks (1996).

Rural Labour in India: Role of State and Markets

Jeemol Unni

Empowering Rural Labour in India: Market, State and Mobilisation edited by R Radhakrishnan and Alakh N Sharma; Institute for Human Development, New Delhi, 1998; pp 440, Rs 450 (hard), Rs 195 (paper).

IN the wake of liberalisation, globalisation and the dominance of the market, rural labour in India has been orphaned. This is not to say that in the pre-liberalisation period all attention was focused on them. If that had been the case rural labour in India would have been 'empowered' today and there would have been no need for this volume. The era of the dominance of the market is also reflected in the lack of interest in social science research on the theme. While the number of readers in society seem to have come down, the remaining demand for non-fiction is mainly concentrated on textbooks, books on computers and management, particularly with the focus on industry. In such a scenario, the Institute for Human Development has to be credited for its zeal to publish a volume focusing attention on the role of state and public action in empowering this forgotten sector of society.

This book consists of 21 papers and an overview article. It is divided into three parts. The first part consists of six papers which present a view of the changing realities of rural labour markets in India. The second part consists of 10 papers reviewing various state interventions in this market. The third section, consisting of five papers, reviews instances of public action through unions, political parties and NGOs in the rural labour markets.

The first chapter provides an analytical overview of the theorising on rural labour markets in developing countries. These theories have been largely preoccupied with wage determination. However, there is a large segment of the rural labour market whose conditions and behaviour cannot be analysed within the framework of wage-centred theories. The rural labour market consists of individuals who obtain various non-wage incomes and any theory has to incorporate the wider question of determinants of returns to labour, both wage and non-wage. It is forcefully argued that theoretical developments need to strike new ground beyond the boundaries of mainstream economics incorporating social institutions and the power structure.

The papers by Bhalla and Sen present fascinating analyses of the changing realities in the rural labour market pre- and post-economic reforms. They argue that diversification of the workforce was the major factor behind rising real wages, and reducing poverty before 1991 and the reverse process has led to deteriorating conditions for rural labour after 1991. Sen argues that diversification into the non-farm sector was encouraged by massive public expenditure during that period. The informal sector is often treated as though it consists primarily of self-employed persons. Breman makes an interesting argument that there is considerable wage-dependency in the informal sector, and this component is growing. The papers by Jha and Krishnaiah are based on micro-studies in Bihar and Andhra Pradesh where they study the functioning of rural labour markets, through labour contracts.

Hanumantha Rao argues that the economic reforms may have possible backlash effects on rural industries and employment. This can occur through displacement of rural industries, 'exit' of inefficient enterprises, and rise in capital-intensity in the industrial and services sector. V M Rao argues that the relief-cum-support measures needed by the poor in the emerging context have to be different from the earlier anti-poverty programmes. The objective would be to support potentially productive and enterprising poor people for a length of time needed to make them self-reliant.

Dev reviews the existing social security programmes of the government for the rural poor and suggests strategies to enhance the effectiveness of the schemes using experiences from various states. The working of most of these programmes is in fact far from satisfactory, excep for some schemes in Kerala. The other papers in the second part analyse existing state interventions such as minimum wages (G Parthasarathy), self-employment programmes (Kurien and Rajeev) and rural work programmes (Nayyar, Terhal and Hirway, Datt, Singh and Reddy and Swaminathan). Parthasarathy argues that while fixing minimum wages, earnings of female members, seasonal unemployment, provision for holidays and social security such as provision for sickness and education of children should be included. In their paper, Kurien and Rajeev call for a reconsideration of the universal need relevance of the IRDP/JRY programmes. These resources may be better utilised in primary education and health to the poo which will generate significant non-farm employment. Similarly, Nayyar argue than while wage-employment programme are essential, they need to build up th productive capacity of individuals and areas to generate larger employment on a sustained basis. Datt cautions that while targeted public work programmes are useful component of an overall pro-poo development strategy, they cannot substitute for a sustained broadbased growth process. Overall, there is agreement tha existing state interventions to provid employment to the rural poor are onl fire-fighting measures and in the long run do not contribute much to sustaine development.

The third part of the book makes inter esting reading. Various authors analys non-government initiatives to improv the status of rural labour. The tradition method of unionisation has been studie for agricultural labourers (Gill) in variou states, e g, Kerala (Kannan) and Andh Pradesh (Reddy). Sharma and Kum analyse historically peasant mobilisatio in Bihar under the extreme left groups

The final chapter reviews the rece trend of growth of non-governmer organisations and their impact on the rur labour market. Chandra and Reddy argu that while it is necessary to be cautiou about the tremendous spurt of NGO acti vity and international funding for them their role in organising and mobilisin

those who have been at the receiving end of the rural labour market has to be recognised.

Overall, the volume presents a useful collection of articles for researchers, NGOs, students and teachers interested in the changing realities in the rural labour market. The impact of structural adjustment on the rural poor and need for state and private initiatives to improve, or at least protect, their interests are clearly focused on. In the final analysis state interventions devised so far fall short of helping the rural poor in a sustained manner. There is need to review the concept of employment security for this segment of the population. New and innovative methods need to be devised. This volume points to the possibility of critically examining existing non-government initiatives in this direction. For a country of India's dimensions and diversity, ultimately only the government machinery can reach all sections of society. The replicability of NGO initiatives on a wider basis has to be reviewed in this context. There is no method for empowering the rural poor nationwide that can completely bypass the bureaucracy and government.

The Challenge of Ecofeminism

K Ravi Srinivas

Ecofeminism as Politics: Nature, Marx and the Postmodern by Ariel Salleh; Zed Books, London, 1997; pp xvi+208, $ 22.5, £ 14.95 (paperback).

THIS book is ecofeminism as articulated by Ariel Salleh, who has made significant interventions in debates on ecofeminism, deep ecology and social ecology. By proposing a common framework that encompasses peace, gender, environment, socialist perspectives based on materialist analysis and insights from critical theory. This is an ambitious project, given the range of perspectives and issues she tackles in this book. Her ecofeminism is claimed as an embodied materialism that aviods the trap of essentialism.

In the first part she provides an overview of women and ecopolitics and argues that ecopolitics, however radical it may claim to be, is often insensitive to gender issues. She places women as the class base for change. This, she argues, is not based on any inherent or essentialist view but on the current positioning of women, many of whom she refers to as re/sisters in the context of capitalist patriarchy and increasing influence of capitalism on a global scale. She is critical of liberal feminism and argues that mainstream feminism has not provided a radical critique of androcentric colonisation by the west. According to her "Women do indeed have radical chains; their social containment in a sexualised reproductive sphere is bolstered by exclusion and harassment from male-controlled institutions...An emanicipation of the relational sensibility of women and its reclamation by women will release earth energies."

In the first part she provides the basis of the ecofeminist analysis and 'embodied materialism'. She analyses the common subjugation of women and Nature through western history, in both theory and practice and domination of women as Nature. Drawing on the work of Sherry Ortner she argues that the core assumption of this domination is the man/woman=Nature divide is furthered by instrumental reason. This dualistic logic negates both women and Nature and women are denied of any voice or agency. In other words this subordination of women and Nature negates life and it is a 'psychosexual fuse'. Based on this she builds up a critique of Marx and Marxism. Marxist critique also suffers from this fatal flaw in that both women, in their capacity as reproducing the conditions of production, and Nature, which sustains the very means of production, are relegated to the background and are not given the consideration they deserve in the works of Marx. She does not dismiss Marx altogether but only points out that these were the missing elements in his works although he was sensitive to the question of degradation of Nature. She argues that the fundamental contradiction in the capitalist patriarchal system is the Nature-woman-man relationship. Capitalist patriarchy, according to her, only aggravates the domination of women and Nature and the global assault on Nature, women and indigenous communities has to be understood in this perspective. She negates the claims that development will benefit women.

Next, she argues that ecofeminism goes beyond the second wave and liberal feminism. By building on socialism, feminism and ecology, it is possible to provide an interpretation of man-woman-Nature relationship that is sensitive to the concerns of women across continents for they face similar, if not identical, threats from capitalist patriarchy. The epistemological framework of ecofeminism as advocated by her is explained in subsequent chapters. The disconnected objectivised prerspective of Nature as *terra nullius* and dualisms that haunt the paradigms which explain man-woman-Nature relationship are exemplified in diverse projects ranging from bioprospecting, genetic engineering to mapping the human genome. Such projects are being resisted by re/sisters, indigenous communities who provide alternative perspectives. An alternative epistemology can be formulated from the life and struggles of indigenous communities, an epistemology that negates narrow specialisation, that tries to understand Nature as dead but through continuous interaction and awareness about the nexus between life, Nature and culture. This epistemology based on embodied materialism is an alternative to the technoscientifc understanding of the environmental crisis and development as the solution for this crisis.

She calls for a reading of Marxist theory that favours abstraction grounded in practice and analysis at several levels. She claims that a standpoint of non-identity which goes beyond the dualistic mode of thinking can be the basis for ecofeminist theory and praxis. In other words we have to rework the historically deleted identity with/in Nature. Such an exercise she claims is part and parcel of dialectic analysis and this is not another essentialist exercise. According to her, "Ecofeminist politics is a feminism as much as it offers an uncompromising critique of capitalist patriarchal culture from a womanist perspective; it is a socialism because it honours the wretched of the earth, it is ecology because it reintegrates humanity with Nature, it is a post-colonial discourse because it focuses on deconstructing Eurocentric domination".

By taking on the various theoretical perspectives she has put forth an ecofeminist critique of Marxism, postmodernism, liberal feminism, etc. As a

critique her work is well argued and ample examples from the grass roots re/ sisters and movements are provided throughout the book. But one is afraid that her work does not take her very far for she tends to generalise the material conditions of reproduction, and the reconciliation between universal viewpoint she advocates and essentialist assumptions is not worked out neatly. Further her epistemology is a brilliant critique but does not provide us a solid theory or framework to combine a historical materialist perspective with a transdualistic understanding of man-woman-Nature relationship.

Perhaps part of the problem is with her extensive use of man/woman=Nature as the underlying logic of western civilisation. Whether this logic alone can be used, irrespective of the context and other social conditions, as the major cause to explain domination of women as well as Nature is a question that one faces while reading her work. Zimmerman (1994) points out that Peggy Reeves offers an alternative account that challenges Sherry Ortner's claim. Morover as Sylvia Bowerbank (1996) has pointed out claiming to speak in the name of Nature or true Nature is problematic, even when such claims are made by women.

The term capitalist partiarchy is used so frequently that it becomes a cliche. The author does not examine in depth the relationship between patriarchy and other relations of production/reproduction. Non-western societies or cultures need not be looked at as ideals or as the alternatives to western capitalist patriarchy for they may subscribe to the logic of man/woman=Nature in one way or other. Throughout the book as one comes across uncritical comments or observations of various struggles, indigenous communities, and some of them are suggested as alternatives. But the issues are more complex than what the author presumes. For instance she is critical of the usage of Geographic Information Systems (GIS) and warns against its use by multinational. But as articles in an issue of *Cultural Survival* pointed out the indigenous communities are using information gathered by GIS as well as traditional knowledg to stake their claims and fight for thei rights. Although her critiques of dee ecology are well meaning it seems that sh fails to notice that deep ecology an ecofeminism need not necessarily b antagonistic. Recent interviews with Arn Naess (published in *Alternatives, Capi talism, Nature, Socialism*) confirm thi Ecofeminism is not inconsistent with goal of deep ecology.

Nothwithstanding these observation this is a significant work and will furthe the debate between ecofeminists an others. It is an important contribution t the ecofeminist discourse.

Mountains and Material Life

Tirthankar Roy

Natural Premises: Ecology and Peasant Life in the Western Himalaya, 1800-1950 by Chetan Singh; Oxford University Press, Delhi, 1998; pp xx + 252, Rs 475.

UNDOUBTEDLY the most fertile new area of historical scholarship in India in the nineties has been 'environmental history'. The role of geography in economics can be studied in broadly two ways. One is to write the history of, say, forests, rivers or 'wastes' as manifold productive resources. Another is to write the history of regions in which geography deeply influences economics. Most of the recent publications in this field are along the former line. A key question in this literature is how colonialism affected economic opportunities via access to natural resources.

Chetan Singh's book on the western Himalaya in the colonial period asks the same question. But it belongs in the latter kind of work. That is, the book is written from the perspective of a region in which 'the sheer presence of the Himalaya' influenced the economy in an overwhelming way. In this account the terrain, the natural resources and material life form closely connected elements. Politics matters insofar as it adapted to or shaped these connections. The book is centrally about these connections. In this respect the book is a singular contribution within the environment history literature. More than that, many of its conclusions have far-reaching significance. It is an excellent introduction to the economic history of a region on which few scholarly works exist. The nature of the interaction described here should apply in parts to a wide area of the mountains beyond western Himalaya. The book challenges almost every stylisation about peasant life that tends to arise from studying agriculture in the plains. The quality of scholarship is impressive and bears the signs of a long and earnest commitment. And barring the rather heavy methodological paragraphs at the beginning and at the end, the book is written in a crisp and clear style.

The seven chapters deal with political economy, agriculture, commons, pastoralism, forests, commerce, and society. Ecology is the primary link between these themes.

The area of study is the present-day Himachal Pradesh. Local environment was a limiting factor in this region. So much so that a 'typical Himachal village' had always been rare (p 42), the most common kind of settlement being a 'hamlet' located close to terraced fields. Agriculture was a main activity only in the low-lying areas, but elsewhere, it was not only a relatively less important occupation, but also extremely labour-intensive. The proportion of uncultivable land in total area was far higher in the hills compared to the plains, and increased steeply with elevation. Agriculture was combined with animal husbandry, pastoralism, mining, commerce, and extraction of diverse resources from the forests.

In the colonial period, the region was composed of a number of Indian states. Geography affected state formation by setting the 'natural frontiers' between them. The relationship between the states and their subjects depended on the kind of economic activities possible. The states needed to and were able to diversify sources of revenue. Natural resources, trade or livestock were no less, frequently more, important as sources of taxation than agriculture. But even with such diverse incomes, the states could rarely become centres of power or wealth. While private property rights in land were not well developed in the pre-colonial period, traditional rights to use were quite strong, for land was neither wealth nor the only means of livelihood. For the same reason, hill society was characterised by a relative lack of social differentiation compared to the plains.

The importance of livestock as an alternative to agriculture made wastes an important resource. Singh's notion of waste as 'intermediate space' reduces the distance between forests and farms, often seen as alternative uses of land. The nature of wastes influenced the kind of livestock that were kept by the peasants, and the emergence of pastoralism as an independent livelihood. Property rights in wastes underwent changes during British rule. There is a view that 'village communities' had rights to use of wastes and forests in pre-colonial Himalayan regions, and that colonialism changed their use by destroying these communities. By contrast, the book argues that such communities had been generally rare, and were created by the colonial state's attempt to define property rights in wastes.

The natural limits to self-sufficiency created opportunities for local and long-distance transactions within the region. Two examples are grain and manure. Peasants in low-lying areas exported surplus grain, and depended on seasonal migration of flocks from alpine villages for manure. This picture of mobility and local commerce in a region where wheeled transportation was almost non-existent is remarkable. Transactions in local necessities combined with extensive trans-regional trade passing through Himachal, the chief product of long-distance trade being wool. Historians who have dealt with long-distance trade of colonial India know that transfrontier trade remains an insufficiently researched area, despite being important for the economy of north India. The book helps to fill that gap.

Colonialism, however, brought in its wake a different and a more penetrating form of commercialisation. Colonialism defined private property rights in land in common with the rest of India. More land was alienated in the late 19th century than before. There also opened up new commercial opportunities of which the most important, and extensively written on, is the market for timber. While forests acquired commercial value, that very process encouraged conservation by the government. Competing claims on forests, such as those of the pastoralists, became peripheral, more so as timber overwhelmed all other customary sources of revenue. Together, the destruction of forests and conservation efforts that focused on the more profitable types of trees changed the very nature of the forests.

On some aspects, the reader may wish for a longer discussion than is available in the book. Basically, the book's scope has a certain ambiguity. It is not exclusively about 'peasant life'. Nor does it give a complete picture of the regional economy, which would require more detail on, say, artisanal industry and commerce. Such ambiguity, however, is inevitable and the book does a fairly balanced job. The account is not always explicitly chronological. In particular, changes occurring in the later colonial period are discussed in specific contexts, for example, timber extraction. This seems to leave some other types of change underexplored, migration being one example.

But, unquestionably, this is a substantial and neatly written work in a new area. It should be read, not only by specialists, but also by anyone with an enduring interest in mountain inhabitants.

Some Aporias of History

Time, Truth and Play in Dangs, Gujarat

Ajay Skaria

Historians and social scientists confronted with pasts imagined differently from history have resorted to one of two strategies: converting oral traditions into the equivalent of archival sources and then writing histories that adhere to the norms of western professional history writing; or by denying any significant traffic between history and other froms of conceiving pasts, subsuming the latter under the rubrics of myth or more recently, memory. This article argues that the Dangi's 'vadilcha goth' or tales about ancestors are an engagement with modernity and its paradigmatic trope, history. The subaltern practice of anomalous and hybrid histories, in the Dangs, produces a multiplicity of pasts quite different from those multiple histories which historians conceive of and increasingly call for.

WITHIN days of commencing fieldwork in Dangs in Gujarat, I realised that Dangis had a rich fund of 'vadilcha goth', or stories about ancestors. These 'goth' often reached back into the 17th and 18th century; they involved detailed accounts of the activities that the narrators' ancestors were involved in. The question is: how is one to think of these stories about the past?

The issues this question raises are more complex than might appear at first sight. The problem is posed by the emergence since the 18th century of an understanding of history which basically shapes the ways in which we think about pasts. Previously, as Reinhart Koselleck remarks, 'histories had existed in the plural'. With the Enlightenment, history emerged as "a general concept which became the condition of possible experience and possible expectation". It "gained an enhanced degree of abstraction, allowing it to indicate a greater complexity, which capability has since made it necessary for reality to be generally elaborated in a historical manner"[1]

"Reality to be generally elaborated in a historical manner": few remarks could be more appropriate. Consider simply how the oppressed and marginal – whether nations, women, lower castes, or other subaltern groups – have sought to give themselves a history, how often the call has resounded: "We must have a history".[2] To claim a history, and to claim that this history is not simply something that can be added on to an already existing history but transforms the idea of history itself – this is a strategy that not only historians but subaltern groups have repeatedly resorted to. Note that what is being claimed here is not simply pasts (this would be unexceptionable, for everybody has pasts) but history. The other pasts are subsumed variously under the rubrics of memory, myth or chronicle; they are what history may grow out of but is fundamentally different from; they are at best the prehistory of history.[3] With modernity, as so many have said or implied, history emerges as a privileged form of being. Thus it is that one of the more serious charges that scholars can levy against each other is often that they are 'ahistorical' (it is surely significant that there are no widespread parallel conceptions of being without sociology or anthropology, and that there are some sorts of parallels in politics and economics).

I do not wish to go into the questions of why history should thus become a paradigmatic trope of modernity, or how the distinction between history and other pasts is maintained. Suffice to say for now that these matters have to do with a variety of aspects of modernity: with the significance accorded to agency, and how having history (making history) is one way to claim such agency; with the significance accorded to reason, and how history is always necessarily from the point of view of the rational subject; with the significance accorded to time as not merely a static backdrop but a dynamic element which itself a principle of transformation, and how history is precisely this kind of narrative about time. The point I am making is much more modest: it is that those of us dealing with the pasts of marginal or subaltern groups have necessarily had to engage with history in this modern sense. We can never be innocent of the modernist trope of history, any more than the subaltern groups we write about can be.

So the question could now be formulated more sharply: how do we, and the subaltern groups we write about, engage witl history? When as historians and socia scientists, we have been confronted witl pasts imagined differently from histor (as, say, with many oral traditions) w have usually resorted to one of tw strategies. Such scholars as Jan Vansin (who in many senses put the study of ora traditions on a disciplinary footing) an his many brilliant students have proceede by converting oral traditions into th equivalent of archival sources, and the writing histories that adhere to the norm of western professional history writing In the process, they have produced nove and exciting histories of regions an subjects, histories that would hav remained impossible if we had stuck t written records. Politically too, ora history has been a way of contesting th colonial refusal to acknowledge that th colonised had any history. Yet thi strategy, though not only valuable bu absolutely required in many contexts, doe almost self-confessedly ride roughsho over the alternative historicities – th different ways of conceiving past presents and futures – that might b involved in oral traditions. For much or history in this genre, rather, oral tradition become a form of history, and the diffe ences between the two are minimised.

A second, intimately linked strateg resorted to by many oral historians, an almost an organising principle of th ethnographic method, involves denyin any significant traffic between histor and other forms of conceiving past subsuming the latter under the rubrics c myth or, more recently, memory. It i salutary to recall that when Levi-Straus made the distinction between hot societie that have history and cold societies th

have myth, he sought implicitly to affirm myth over history. But so hegemonic was the notion that history was the desirable way of thinking of pasts that to describe any society as possessing simply a mythic consciousness, as lacking history, seemed not merely inappropriate or wrong but even politically conservative.

I do not wish to adopt the historicist tacks that were taken to criticise Levi-Strauss, or that, in a related vein, have been taken in recent times to criticise anthropology's practices of othering; I do not wish to claim that I espy history everywhere. What worries me is something else. It is that in this strategy both myth and memory are usually cast as that which is spatially or chronologically apart from history. Thus, scholars conventionally assume that oral traditions survive most vigorously in non-literate and 'traditional' societies. With the emergence of a literate culture, oral traditions about the past are expected to be slowly forgotten, to be replaced by a literate historical culture. It was in this spirit that Ashis Nandy once remarked that the majority of Indians still have a mode of thinking which is distinct from history.[5] Such remarks often seem to presume an innocence from history. And even if it could have been claimed in earlier centuries, alternative historicities today are not simply innnocent of history but emerge through an engagement with it.

In this context, I would like to argue that vadilcha goth are not local traditions still preserved because of some Dangi isolation from the larger world. Rather, they are an engagement with modernity and its paradigmatic trope, history. By this, I do not mean that they are anti-modern (as Partha Chatterjee has remarked acerbically, one can hardly choose to be modern or anti-modern, one can only talk of strategies for coping with modernity);[6] rather, I refer to an engagement that exceeds the modernities which the colonial and post-colonial state and elites have espoused. I would like to focus here on two crucial dimensions of this Dangi engagement: the ways in which it refigures and exceeds modernist time and truth. In the process, I hope to foreground the subaltern practice of anomalous and hybrid histories, which in Dangs produces a multiplicity of pasts quite different from those multiple histories which we, as historians, conceive of and increasingly call for.

The Time of Goth

Dangs is an approximately 660 sq mile area that now forms a district in south-eastern Gujarat. It is inhabited largely by bhils, koknis, and varlis – communities that the modern Indian government would classify as scheduled tribes, and that the British described as the wild tribes. In the 18th and 19th century, Dangs was ruled by several bhil chiefs. Though it never formally became part of British territory, its chiefs were subordinated to British power in the early 19th century. In the 1840s, British power in the region was further consolidated when colonial officials secured a lease of Dangi forests. Since forests covered most of Dangs, this effectively meant that the whole region came under British authority. As part of their efforts to produce more timber from Dangi forests, colonial officials prevented Dangis from using forests for subsistence, causing widespread and persistent local resentment.

As used in Dangs, the word goth can be broadly translated as story, narrative or account, and is ubiquitous in everyday life, being deployed to describe a range of narratives. People tell their goth to visiting officials, which is to say that they make a representation. They tell the goth of what they did during the day. And of course they tell goth of divine figures, of hunting, of ancestors, of former times. So goth in that sense can be the story or account of virtually anything.

Nevertheless, there are broad genres of goth. Stories of Dangi pasts are often referred to interchangeably as 'juni' goth, 'mohorni' goth or 'puduncha' goth – all phrases meaning 'stories of former times' or 'old stories'. Within these juni goth there are at least two broad genres – the 'devdevina' goth, or stories of gods and goddesses, and the vadilcha goth, or stories of ancestors. The bulk of the devdevina goth, literally 'stories of the gods and goddesses' tell of dealings between deities and spirits such as Vadudev, Bhutdev, Simariodev, Vaghdev, Sitalamata, Kanasarimata or the many malevolent female spirits known as joganis. There are also goth of the two major popular epics of the subcontinent, the *Ramayana* and the *Mahabharat*. These epics, radically different from the textual versions of the plains, are situated within Dangs. There is the village of Pandva, where the Pandav brothers visited; the village of Subir, where Shabiri Bhilin stayed when she met Rama; and several other such places.[7] Devdevina goth are set in a very distinct time – that before the time of the humans. The goth are often about the making of the physical and geographical features of Dangs by gods, goddesses and spirits.

In contrast, vadilcha goth is often used as a shorthand to refer to all stories involving humans. The word 'vadil' can mean both lineage ancestor and, more broadly, elders, whether living or dead. The time of humans does often involve divine beings, and such stories are both vadilcha goth or devdevina goth. Some of these tell of ancestors' encounters or dealings with spirits, gods or goddesses; they are about how Dangs and other regions were made suitable for humans. They tell, for example, of how humans were given corn to cultivate with, how the 'mahua' liquor that Dangis drink was discovered first by Vadudev and then passed on to humans, how kingship was given to some Dangi chiefs, and so on. However, most vadilcha goth have an entirely human cast. Some are about the loss of forests to the forest department, or the coming of the British. Others are about the everyday lives of ancestors: of their migrations from village to village, their harassment by the British and the forest department, their modes of livelihood, their alarm at the first motorised vehicles, the prices they paid for goods, and of the disputes amongst bhil chiefs.

Running through vadilcha goth is a very distinctive understanding of time. What I mean by this can be illustrated by contrasting it with the acknowledgement of coevalness, the preferred strategy in that classic, Time and the other. Fabian argues that imperialism and anthropology were both fundamentally based on the denial of coevalness, that anthropologists placed the societies they studied in a time different from and before their own. In opposition to this, Fabian called for the acknowledgement of coevalness, or a recognition of the shared historical time of anthropologists and the societies they studied.[8]

I do not wish to imply that Fabian was wrong in calling for such a strategy; it is certainly often required for strategic and political reasons. But let us step back from that issue for a moment, and ask: what is the vision (broadly shared by a substantial section of the most radical and exciting social theorists of the eighties and early nineties) from within which the denial of coevalness seems such an imperialist act, and acknowledgement of coevalness the most appropriate strategy against it? A deeply modernist one, in the very direct sense that modernity is about a particular kind of relationship with time. As Vattimo reminds us, "modernity is that era in which being modern ... becomes the fundamental value to which all other values refer". Modernity defines itself by claiming to be at the cutting edge of time, to be always contemporary, and to always be

overcoming itself (this after all is the paradoxical sense in which one way to be modern now is to be post-modern).[9] The acknowledgement of coevalness seized on this index, time, to claim modernity for the anthropologist's subject, and to attack the old imperialising strategy of denying modernity by denying coevalness.

Time in vadilcha goth is subtly different from this. The two major epochs (this word is not entirely appropriate, as will become clearer below) within which most Dangis frame their pasts are 'moglai' and 'mandini'. Roughly speaking, moglai is the time when Dangis moved in the forests without restrictions, when they raided the plains to collect a due called 'giras', when they had a distinctive pattern of political authority. Moglai, in this sense, informs radical politics in the Dangs today. Mandini is both an epoch, and an event that marks the end of moglai. With mandini, often associated with the British subordination of the region, Dangi political authority was undermined and they could no longer move about as formerly, or raid surrounding plains.

Now, moglai could easily be glossed as the Dangi version of a romanticised golden age of freedom. But this would be an extremely reductive reading: the epochs of moglai and mandini involve rather a forceful acknowledgement of coevalness. The notion of mandini seizes on colonial and post-colonial state power and accords to it a revolutionary role in the shaping of contemporary Dangs. It creates a shared historical time with imperialism and colonialism, and points to the particular forms of domination involved in that time. Furthermore, the epochs mime the distinction between the pre-modern and the modern. In the truisms of western thought, for example, the modern is cast as a radical departure from history, as a revolutionary epoch – this is why all that preceded it can be lumped together as pre-modern, and before history. So too with mandini which is similarly a revolutionary epoch, above all constituted by colonial and post-colonial state intervention.

And moglai, even if its etymological roots may be a reference to Mughal rule, in everyday usage often refers to that which precedes mandini. Subsumed within moglai are several other epochs which had been important formerly. For example, there was the time of 'gavali raj', which may be a reference to the reign of the yadav kings of Devgiri (later Daulatabad, near Aurangabad) who reigned from A D 1216-1312.[10] Similarly, there is the epoch of 'Aurung-badshah', the term Dangis use to refer to what may be the Mughal emperor Aurangzeb. There is also the period of what is known as the 'kuplin-bahadurin', which may be a reference to the Company Bahadur, as the British East India Company was sometimes called. But these epochs are not associated with any major events; they are invoked by narrators principally as part of a narration of epochs that demonstrates knowledge of vadilcha goth. In other words, the veracity of goth is not dependent on their being from these epochs; for this, it is sufficient for goth to be from moglai.

Even more to the point, moglai and mandini do not stop with an acknowledgement of coevalness. These Dangi epochs are subtly different from epochs or periods in the sense that professional historians use such terms. For the latter, an epoch or a period is marked by chronological contiguity and continuity: despite some overlap, it could be broadly said that one epoch succeeds another. When Fabian insists on the acknowledgement of coevalness, what he means is that it should be recognised that the colonised share the same position in the linear time of modernity as the colonisers, a time after the pre-modern. Sometimes, Dangi narrators too talk similarly: thus, moglai often is identified with the precolonial and early colonial period, and mandini is associated with 'gora raj' or British rule. But this is not the only way many Dangis talk. Quite as often, Dangi epochs traverse diverse chronological times, almost running parallel to each other. It is not unusual for events that occurred as recently as 20 years back – such as say incidents during hunts – to be part of moglai, and those that occurred 200 years back to be part of mandini. That is to say, mandini is not only after moglai but also along it, parallel to it. Indeed, in some very suggestive ways, moglai is about what is extra-colonial. By extra-colonial, I obviously do not only mean pre-colonial – it is precisely that kind of chronological separation that I am trying to avoid. What I mean is something that often includes the pre-colonial, but is in more important ways defined in opposition to the colonial and postcolonial, in opposition to the relations of domination over Dangs that surrounding plains areas have established. Thus, rather than being about an unsullied Dangi space, or an autonomous world or hidden transcript of subaltern groups, moglai is about spaces and times created by traversing and exceeding colonialism and the relations of domination that it is associated with.

Ranajit Guha has pointed to how much history writing is statist, which is to say that it "authorises the dominant values of the state to determine the criteria of the historic". Even stories of resistance to this narrative are comprehensible within its terms:

> This is a level quite accessible to statist discourse: it is never happier than when its globalising and unifying tendency is allowed to deal with the question in gross terms. It is a level of abstraction where all the many stories ... are assimilated to the story of the Raj. The effect of such lumping is to oversimplify the contradictions of power by reducing them to an arbitrary singularity – the so-called principal contradiction, that between the coloniser and the colonised.[11]

Goth of mandini and moglai can be thought of as sustained engagements with this statist narrative. Goth of mandini tell of the interventions of the British and the post-colonial state – mandini, above all is about the initiatives of the 'sarkar'. But they extensively displace that statist discourse, and focus instead on Dangi refigurings of it. Goth of moglai move further beyond the 'arbitrary singularity' of that discourse: they traverse mandini (rather than being always before it) and create a multiplicity of local and regional narratives that have little do with the concerns of statist power. Through their refiguring of time by the initiatives of the sarkar, through their exceeding of statist narratives, goth underscore the domination that has marked their colonial and post-colonial modernity, they render its intimacy into an exteriority.

THE CONSTITUTIVE OUTSIDE OF TRUTH

A similar engagement with modernity is very much foregrounded in Dangi concerns with establishing whether vadilcha goth are 'khari', a word which can for the present be glossed as 'true'. Maybe we can begin understanding khari goth or true stories through what is beyond them, such as the many tall tales in Dangs. Often very whimsical, with a sting in the tail, they are about a range of themes – about the sexual peccadilloes of men and women and gods and goddesses, about heroic figures who successfully undertake daunting tasks, or about tricksters who get out of the most difficult situations. While there is no specific word designating these stories, they are recognised as a distinct genre. Most of all, they are considered as imaginary, in the sense of bearing very tangential relations to figures of the past or present.

These stories could be called false, but that is not a word many Dangis would voluntarily use to describe them. Instead,

It may be helpful to think of these goth as above all about play. One way to think of the playfulness of these goth is to consider their ludic element. Imaginary goth are often narrated at occasions known as 'tamashas', usually held in the slack agricultural period before the monsoons. Large events where alcohol flows freely, tamashas, enacted increasingly by semi-professional performers and troupes from the neighbouring area of Khandesh, are sometimes spread across two or three evenings, and are attended by hundreds of men and women, many of whom walk over a day or two from distant villages to participate in it. Imaginary goth are also narrated at casual or spur-of-the-moment gatherings, when men and women are relaxing in the evenings. Such occasions are overwhelmingly preponderant in relation to the tamasha: they occur almost every second or third evening in some corner of every village. On such occasions, some person with a particularly good reputation as a 'gothiya' or teller of tales may, under pressure from others, start off on a goth; slowly, others from surrounding huts may join in. And if there is mahua liquor to lubricate the telling and listening, the occasion gains in gusto and vigour.[12]

The understanding of imaginary goth as playful is also evident in the way the figure of the gothiya or storyteller is constructed for these goth. In all genre of goth, of course, the gothiya is so central as to render meaningless those conventional oppositions which assign such oral traditions to a pre-authorial folk world, and contrast it to the culture of print and the emergence of the author. But the reasons for and manner in which the gothiya is accorded centrality vary. In imaginary goth especially, it is the narrative skill and style – the pauses, interjections, glosses, gestures, and sudden flurries of detail that narration involves-of the gothiya (usually though not necessarily, a man) which is valued: he makes the goth anew with each telling.

Of course, several of the goth told on such occasions are extremely contentious, and lead on to heated arguments. But nevertheless, the playfulness of these occasions allows goth a certain extricability from partisan, political or other considerations, and contentiousness rarely prevents goth from being told or performed.

Such playfulness may tempt us to read these goth as marginal or inessential. That is to say, imaginary goth could seem as a relatively inessential form of leisure, a break from the more serious work of everyday life which khari goth are about; it could seem that it is the very inessentiality of imaginary goth that defines the more important khari goth. Even some Dangi readings may seem to support such an interpretation: on some occasions, imaginary goth have been described to me as 'emaj', a word which could be translated as 'just like that' or 'inconsequential'.

Now, it would be easy enough to undermine such an interpretation. Imaginary goth form part of everyday Dangi language, with casual references to characters from them abounding in casual conversation; and highly contentious arguments often take the form of contenders narrating to each other goth supporting the kind of values they valorise. As such, it could be argued that these goth posit, sustain, challenge, contest and perhaps even create values central to many Dangis. Yet, there is something dissatisfying about undermining, in this manner, the interpretation of imaginary goth as marginal. To show that imaginary goth also involve relations of power – surely this is no more than a predictable preliminary gesture in a context where we increasingly realise the ubiquity of relations of power? And here, preliminary to what? To the point that imaginary goth are as central to Dangis, if in different ways, as khari goth? Here, centrality comes to signify an anodyne sameness (ironically, this is also the dominant way in which historicism today conceives difference), and any ascription of marginality to imaginary goth can only be understood as false consciousness or ideology.

Perhaps it would be more satisfying to work within the ascription of marginality but against the grain of the way in which our habits tempt us to read marginality. Maybe we should consider another sense in which imaginary goth are playful: their play in relation to the truth of khari goth. That is to say, because of their independence from time and place, they are considered to be beyond the claims to truth and falsity which khari goth involve. While khari goth are those that successfully sustain a claim to refer to a particular time and space, these stories do not even advance that claim, whether successfully or unsuccessfully. In this sense, they are not the negation of khari goth but its constitutive outside: they define what is outside the field of khari goth, cannot be judged by its criteria, and yet makes possible the very imagining of khari goth. It is precisely in this that their peculiar marginality resides: they are marginal not because they are inessential but rather because they come into visibility only at the margins of khari goth. Nor, even, is it adequate to think that when questions of truth become important, then khari goth predominate and playful or imaginary goth become impossible: forms of playfulness provide also the language in which vadilcha goth exceed the truth of history. To pursue these points, consider the enactment of khari goth.

Truth of Vadilcha Goth

In contrast to imaginary goth, vadilcha goth posit an intimate connection with time and space; every narration of them constitutes a claim to tell what actually happened at some specific place in some specific time. They involve the claim to be khari goth, or true stories.[13] But establishing most vadilcha goth as khari is a difficult task. This is not merely because they are highly fragmented and diverse, with virtually every locality, lineage or even individual having their own different goth. It is also because of their inextricability, in the eyes of most Dangis, from practical, partisan, political, emotive, calculative or other considerations. Consider goth around the lineage of male descent. The lineage has since the early 20th century been one of the crucial arenas within which Dangi politics is conducted. There are currently 14 chiefs who are officially recognised by the Indian government as the descendants of the former rajas or kings of Dangs. Myriad others are recognised as their close kin, while yet others are recognised as descendants of those who held land-grants or village headships under these rajas. Such recognition as descendants is not only an honour (turbans and shawls are publicly bestowed on the rajas and their associates at a darbar held annually), but is often accompanied by a substantial political pension.

In this context, to know and tell goth of the power wielded by one's ancestors is to make an implicit claim to some sort of power. Also, people often narrate goth designed to impugn claims of other lineages, claiming for example that a person widely recognised as the male descendant of some vadil is not the true descendant, or that the true raja or patil was not the specified vadil but someone else. Even lack of knowledge of goth takes on different implications depending on its relationship with claims to power. Officially or popularly recognised chiefs are not particularly disconcerted when they do not know goth: their authority is by now too secure in usual contexts for it to matter, and lack of knowledge is easily ascribed to vagaries of transmission. But those

chiefs who are neither officially nor popularly recognised feel deeply worried when they do not know their vadilcha goth. Such is the case with one lineage of Vasurna. The father of the present lineage head did not listen much to stories when he was young, and as a result the latter does not know the stories. Since the lineage now claims a share of Vasurna, he has expended considerable effort in meeting persons of related lineages who might know goth of his ancestors, plying them with them liquor and trying to prise stories about his lineage out from them – so far with little success. Had he known such goth, and were they persuasive, he might at least have secured some popular acceptance of his claims (though of course this would not have secured him official recognition). For well told goth can actually create power. Haipat Lasu, a distant descendant of the Ghadvi chief Silput raja, has through his inventive retelling of vadilcha goth secured popular authority as a chief far beyond what either descent, alliances or official recognition would allow him to claim.

Even where not so directly connected to personal claims to power, vadilcha goth are still deeply political. Goth of how the British took over the forests, of how ancestors rebelled against colonial power, of raids on plains by ancestors, of oppressive state practices, or even of the plenitude of modes of subsistence during moglai question the legitimacy of the state. Goth of how koknis and bhils behaved with each other in former times, of how koknis brought agriculture to Dangs, of how a particular witch was dealt with – all of these are involved in complex everyday politics.

Because of this inextricability of vadilcha goth from practical, partisan, political or other considerations, they are (unlike equally contentious imaginary goth) rarely performed on occasions like the tamasha or the 'thaali'. As events in which almost anybody can participate, these are scarcely desirable occasions for discussing such matters. More appropriate is everyday conversation. Old men and women, reduced to immobility by age, might often tell children and others the stories of their youth, and the stories they learned from their vadils. In evenings when friends get together and drink liquor, or during long afternoons when there are no pressing agricultural tasks, or while working with friends in the field, conversation may turn to vadilcha goth. What makes such occasions particularly appropriate is that, unlike the tamasha or thaali, they are not open to virtually anyone who might stray in. As with other everyday conversation, they involve spaces of intimacy with highly flexible and contextual boundaries. When goth that are relatively uncontentious are being told, such as those of how the British took over the forests, these spaces of intimacy have boundaries inclusive enough to take in virtually every Dangi (though not necessarily persons like me). But when the truth of goth narrated is a more contentious matter, the spaces are quite restrictive: it is not unusual for narrators to segue out of one goth into another relatively inoffensive one when a new person joins the group. And when goth involve challenges to the authority of very powerful persons or lineages, they are narrated almost secretively – often after nightfall, when only members of the narrators' huts and those they have specifically invited are around. Such spaces of intimacy are themselves deeply political: they are not based simply on friendships or blood-ties, but are also part of the effort to build alliances and persuade listeners that the narrator's goth is the most khari or true.

Persuasions of Truth

Yet, persuading listeners about what is or is not a khari goth is as a task scarcely innocent of colonial and post-colonial power. There is the importance of 'jod', which can be translated as conjoining. The confluence of different accounts, especially accounts by narrators whose interests are believed to diverge, is the most self-evident form of jod. Amongst the most persuasive forms of jod is the claim to affirmation of the goth by the written documents of the sarkar or state. Because the sarkar constitutes Dangi realities in profoundly inescapable ways, it is thought of as enormously powerful, often even omniscient in its knowledge of Dangs – its records will contain a true account Bhil lineages who consider themselves dispossessed often assert that proof of their having held the gadi or seat of power in former times will be found in the district records. The members of a dispossessed lineage of Ghadvi (one of the principal chieftancies in Dangs) went further in 1988. Seeking to assert a claim to the gadi of Ghadvi, they searched British records at the district headquarters at Ahuwa to find proof of their having formerly held the gadi. Meeting with little success, they ventured as far as Sakri in the old Khandesh district to find the records, again with no success. Now too, the insist that a photograph of their ancestor, the early 19th century Ghadvi chief Silput raja, can be found at Delhi.

Equally significant, in this context, is the association of writing and truth. As I have argued at length elsewhere, in the course of the 19th and early 20th century, the centrality of writing to the exercise of colonial power was accompanied by a fetishisation of writing, especially that associated with the sarkar – hence, of course, the emphasis on the written records of the sarkar in establishing the khari nature of a goth. But the aura of writing, with its connotations of power, extends further. Thus, some families in Dangs have written versions of their goth; this is thought to testify to their khari nature. In these senses, truth is thought of through tropes that are fundamentally colonial.[14]

This is scarcely to suggest, of course, that the records of the sarkar are always treated as khari. When these records contradict claims of goth, they are likely to be disregarded; they are significant only to the degree that they are invoked by Dangi narrators, whether to affirm or contest the khari nature of any goth. Besides, other kinds of jod are very important too, and sustained efforts are made to secure them. For example, in 1994, a discussion was held between various descendants of a 19th century Kokni, Dadaji Patil, where different versions of the 'same' goth (about how their ancestors moved from one village to another to eventually reach Dangs) were put together over two evenings to produce a khari account of their migrations.

Also, narrative strategies other than jod are important too in making a goth seem khari. Narrators are sometimes believed to be telling khari goth when they demonstrates a command of detail. Detail in a goth is evocative, linking it up in as many directions as possible with other goth. By alluding to details from other goth already considered khari, the khari nature of the narrrator's goth is established by association. Indeed, there is almost a superfluity of detail, an extensive elaboration of details that do not really matter. By introducing abundant detail in this way, narrators demonstrate their knowledge, showing that what they tell is likely to be true. Goth thus abound in references to now-vanished villages, to trees that stood at the time and place of the goth, to the clothes the protagonists wore, or how they looked.

Depth of recall is a another narrative strategy likely to make a goth seem more khari. The further back that a narrator can take her or his account, or the longer the number of ancestors through whom a person can trace descent, the greater the

creation of such histories. Also, while they may be radical in terms of their challenges to the canons of history, there is nothing necessarily radical about them in terms of their commitment to a related politics of subaltern empowerment. In some cases, the surplus of hybrid histories springs from their fetishisation of history, as for example in Hindu fundamentalist constructions of the Babri masjid-Ram Janmabhoomi dispute.[18] It is important to recognise this, for else we slip into claiming an (infra)structural site for hybrid histories; we assume that they are always already empowering for subaltern groups. It is not because hybrid histories are new or are always empowering to subaltern groups that they are fascinating; it is rather because subaltern struggles against domination will be about accentuating the hybridity of their histories; they will be about engaging with (challenging, affirming, ridiculing) that paradigmatic trope of modernity – history.

Sino-Indian Border Dispute Reconsidered

Neville Maxwell

The Nehru government sought to decide for itself where India's borders with China should lie and then impose the alignments it had chosen on Beijing, refusing to negotiate them. That meant that unless Beijing surrendered to India's territorial claims to Aksai Chin and areas north of the McMahon Line conflict was inevitable. China's military action in 1962 was reactive and pre-emptive, and that India suffered 'unprovoked aggression' is a self-serving myth. That there has been no settlement of the Sino-Indian borders is the consequence of Nehru's policies, to which successor governments, except Narasimha Rao's, have strictly adhered.

I
'The Chinese Aggression of 1962': India's Grand Delusion

IN his May 1998 letter to president Clinton the Indian prime minister A B Vajpayee justified his government's nuclear tests by citing China's 'armed aggression against India in 1962' and the unresolved Sino-Indian border dispute.[1] India's political class, taking its lead from Jawaharlal Nehru, has from the outset maintained that the dispute and border war were the result of China's expansionism and, at the last, a 'massive aggression' which took India by surprise and led consequently to the collapse of its army. China's account is contrary, charging India with intransigence and irredentism and presenting its own military action as reactive and pre-emptive. It is timely to reconsider, with the added perspective of nearly 40 years and in the light of new material, the causes, in the policies of the two governments, which led to war and left the border dispute unresolved.

The Republic of India and the People's Republic of China faced a common task when they came into existence in the middle of the century: completion of the conversion of their frontiers into boundaries. That was in fact among the first formal expressions of their new identity as modern states, as they moved to emulate and catch up with the states of Europe which in the preceding three centuries, in step with the emergence of nationalism and the rise of the nation-state, had pioneered the introduction of a new political institution, the boundary: a line agreed in diplomatic negotiations (delimitation), jointly marked out on the ground (demarcation), accurately represented on a map, and described in a treaty between two abutting sovereignties which thus recognised the limits of their own and their neighbour's territory.[2] Pre-modern states could exist within frontiers, which were not lines but areas, zones of transition between state powers: modern states need boundaries.

So far as China was concerned when the PRC was established in 1949, the problem of the Sino-Indian frontiers represented an important but small element of an immense task, negotiating or renegotiating to achieve agreed and accurately defined limits to sovereignty with about ten states, contiguous with China over tens of thousands of miles in often inaccessible terrain. Many sectors of that vast periphery represented the high-tide marks of foreign encroachments on the Chinese Empire, and the ousted Nationalist (Guomintang) authority had bequeathed irredentist commitments to the recovery of such 'lost lands'. Beijing's new men recognised that to take up that bequest would be to provoke intractable quarrels with many of its neighbours, particularly and most dangerously with the Soviet Union, inheritor of the vast far-eastern tracts of Chinese imperial territory annexed by tsarist Russia under the imposed treaties of Aigun (1858) and Peking (1860) Accordingly they decided that the new China would settle its boundaries on the alignments on which history had left them. Zhou Enlai used the occasion of the 1955 Afro-Asian Conference in Bandung to declare his government's approach:

> With some of our neighbouring countries we have not yet finally fixed our borderline and we are ready to do so...But before doing so, we are willing to maintain the present situation by acknowledging that those parts of our border are parts which are undetermined We are ready to restrain our government and our people from crossing even one step across our border. If such things do happen, we should like to admit our mistake. As to the determination of common borders which we are going to undertake with our neighbouring countries, we shall use only peaceful means and we shall not permit any other kinds of method. In no case shall we change this.[3]

Later developments gave that declaration of policy much significance, and it therefore deserves analysis. Zhou makes the first step towards boundary settlement a declaration that some sectors are undetermined, with their identification. Second comes a stand-still agreement, rigorous mutual maintenance of the status quo coupled with readiness to admit and correct error if trespass occurs. Third, he looks forward to future negotiations, and offers the assurance that China will use none but peaceful means in resolving territorial disputes. Finally, he issues a warning that China will not tolerate any other approach, implying that a neighbour's use of force would be met by force.[4]

The succeeding half-century saw China implementing the policy laid down by Zhou for the most part consistently and scrupulously, and with marked, and now nearly complete, success. Boundary treaties were negotiated and sealed with Burma, Nepal, Pakistan, Afghanistan, Mongolia, Korea, and Laos. Negotiations are in train with Viet Nam and, to the extent that New Delhi will allow, with Bhutan: in the case of Russia and the central Asian states of the former Soviet Union negotiations have been completed, and boundaries agreed subject to caveats on a few specified points on which disputes have been left unresolved for settlement at some indefinite future date. In three instances 'peaceful means' were replaced by force of arms: with India, the USSR and Viet Nam.

In the case of the Sino-Soviet borders, Moscow initially refused to renegotiate the 19th century treaties by which the Tsars had annexed the great tracts of the Qing Empire which became Siberia and the Maritime Province, suspecting that Beijing's insistence on negotiation cloaked the intention to reclaim that territory Conflicting readings of the treaties which made the Amur/Heilungjiang and Ussuri Wussuli Rivers the borders led to Soviet use of force to assert the claim to exclusive rights over the entirety of the rivers and all the islands within them, and China's resistance took the neighbours to armed conflict in 1969, and the brink of nuclear war.[5]

It was not until 1987 that, under Gorbachev's leadership, the USSR agreed to renegotiate the Sino-Soviet borders and accepted the relevant principle of international law – that, in the absence of any treaty provision to the contrary, the navigable nature of the border rivers meant that the line of separation of sovereignties lay not on the Chinese bank, where

Moscow's claims had put it, but along the thalweg (an imaginary line along the deepest part of the main channel). The corollary was that the riparian neighbours enjoyed equal rights in use of the rivers. Beijing responded promptly to Gorbachev's reversal of his predecessors' position, negotiations were quickly opened and led in due course to a treaty giving the needed precise definition of the Sino-Soviet boundaries, on the eastern rivers and on China's western border. In 1997 the heads of state of Russia and China, meeting in Beijing, proclaimed their border settlement as 'a model for resolving problems left over by history' through negotiations based on equality, mutual understanding, and concessions.[6] The Central Asian successor states to the USSR have also settled their boundaries with Beijing.

In the case of Viet Nam, China, under Deng Xiaoping's leadership, used a trivial boundary dispute, concerning distances of no more than a few hundred metres, as the pretext for an attack intended to 'teach a lesson' – the lesson being that China's hegemony must be accepted. That breach stands as a malign but solitary exception to China's otherwise principled and pragmatic approach to the settlement of boundaries.

In comparison to the magnitude of China's border problem, the task facing independent India when it emerged from the British raj in 1947 was minor. Extensive sectors of India's borders had already been transformed into boundaries by the departed imperial power. Where Pakistan had been separated, international boundaries had been laid by the Radcliffe Commission along what had been internal administrative divisions; the British, after wars and vexed negotiations, had agreed an Indo-Nepali boundary and demarcated it – that is, marked it out on the ground – and largely achieved the same with the other Himalayan states, Sikkim and Bhutan.[7] But the attempts of the British governments in London and India to reach agreement with China to create Sino-Indian boundaries had failed.[8] In the east, where what became independent India's North-East Frontier Agency (NEFA) marched with Tibet, and in the west, where Ladakh, in the Indian-held part of the state of Jammu and Kashmir, met Sinkiang and Tibet, there lay only frontiers – zones wherein the limits of sovereignty were indeterminate but, at first, separated. The potential for conflict, and the need for negotiation, lay in the inevitable impingement of the administrations of the two new states as those were extended into the frontier zones.

When administrative contact was made, the absolute and conflictual differences between the approaches of Beijing and New Delhi immediately became apparent.

To recapitulate: the Chinese approach, as outlined by Zhou Enlai at Bandung and implemented thereafter in practice, looked to the following steps: (1) identify and declare such sectors as required definition with the neighbouring government; (2) agree jointly with the neighbour on maintenance of the status quo so that contact between forward patrols, with the risk of conflict and casualties, could be avoided; (3) negotiate to seek agreement on a mutually satisfactory boundary line, taking into account any relevant treaties, current positions, traditional movements and uses, etc; (4) establish a joint boundary commission to mark out the agreed line on the ground; (5) seal the agreement in a new and comprehensive boundary treaty.

Before similarly summarising the elements of the approach evolved for India by Jawaharlal Nehru and his advisers in the first years after independence, it is relevant to consider the character and historical context of Indian nationalism, which had a powerful and pervasive effect on the Nehru government's approach to the problem of settlement of the Sino-Indian boundaries.[9]

In the 1950s and 1960s there appeared to be a clear distinction between two separate currents in Indian nationalism, on the one hand secularist, on the other religious, specifically Hindu; but for both, the defining principle for their imagined India was territorial, creating a nexus between the two apparently opposing schools in the concept of 'sacred geography'. The bloody partition of 1947 might have been expected to shake, even destroy, the idea that India's territorial limits were historically fixed and absolute, but for Indian nationalists, both secular and Hindu, its effect was the contrary: any territorial challenge, internal or external, came to be felt as an attempted desecration of that sacred geography.[10]

The seedbed of Indian nationalism in both its variants had lain in the anglophone elite cloned by the British rulers in their own image, as that class grew through its developmental stages – from servitor class, through challenger movement, to inheritance of power. The great debate throughout that epoch was over the historical identity of India before the establishment of the British raj. The ruling British view, most famously expressed by John Strachey in his 1888 book, *India*, was that "there is not, and never was, an India, or even a country of India, possessing, according to European ideas, any sort of unity, physical, political, social or religious". In their efforts to fix borders for India the British did not see themselves as marking out an existing nation, but the opposite – creating, and enlarging, a political entity by defining its limits. And that entity was not a nation-state but "an empire like other empires, an assemblage of diverse territories and peoples joined together by British military might, diplomacy and duplicity over many years and then maintained in being by means of the forcible application of British control over non-British peoples".[11]

As the nascent, polyglot elite grew into its challenger phase, however, finding themselves with that prime characteristic of national identity, a common language (albeit in this case a foreign one, English), so they began to conceive and present themselves as members and representatives of 'the people of India', the mass whose existence as such Strachey and his contemporary compatriots had denied. Over the years the argument which Indian nationalists evolved to substantiate their demand for political power hardened into a faith, "the fervent belief that an Indian nation had existed through time – defined by culture, common experience, custom and geography".[12] That perception served as the attitudinal prism through which the Nehru government viewed the task of settling the Sino-Indian borders. If India had 'existed through time', then it followed, in the perception of independent India's first leaders, that its "traditional and customary boundaries had long existed and had evolved naturally, since they were based on the activities of populations and cultures and on geographical features such as mountain ridges and watersheds".[13] Indeed, the "northern frontier [had] lain approximately where it now runs for nearly three thousand years".[14] A corollary was that India's " 'historical borders' were necessarily linear", which is to say precise.[15]

The broad lines of that theory may be traced in the Indian diplomatic argumentation to Beijing over the borders. But its most detailed elaboration came much later in a work of advocacy of the Indian approach disguised as scholarship, written by an Indian official who had been closely involved in his government's handling of the border dispute, T S Murty.[16] Murty argues that a frontier, and the line of exact separation within a frontier (i e, the boundary), comes into existence through natural human interaction, a 'process of historic consolidation' or 'crystallisation'; and needs for validity recognition by only one of the two states concerned. Such 'historic delimitation' obviates the need for delimitation by diplomatic process, which Murty calls 'formalisation' and belittles as a mere 'garnishing' of the real boundary-forming process by historic gestation. To him

'public announcement' of an alignment by the validating government will suffice to finalise a boundary, no 'formalisation' then being necessary.

From that ideological position adopted by the Indian government it followed that, unlike other states which found it necessary to negotiate agreement with neighbours as to the alignment of their common borders, India already possessed fixed borders with China, negotiation thus being otiose. The only necessity was for the Indian government to 'discover' the exact alignment of the country's borders with China through its own archival research, with consultation of history and mythology and taking security interests into account. Once the appropriate alignment had been decided upon it could be announced and depicted on maps. Indian posts would be set up "along the entire frontier ... especially in such places as might be considered disputed areas", as Jawaharlal Nehru was to instruct his government; and the resulting manned boundary would "not be open to discussion with anybody" [17]

Thus India: (1) would insist that all sectors of its claimed border with China were already defined; (2) as soon as possible would advance its state forces into the territory it claimed; (3) would refuse to enter into any agreement for maintaining the status quo until all territory claimed was under Indian control; (4) would at all stages refuse to submit its claimed boundary alignments to negotiation. Each of those points was in absolute contradistinction to the Chinese approach and in sum they amounted to an insistence that for India the definition and consolidation of boundaries with China would be a unilateral process.

Such a one-sided procedure is nugatory in international law:

> An international boundary cannot be fixed solely by the administrative act of one of the adjoining states. At least two parties must be involved and their joint efforts are necessary in order to effectuate an acceptable division between their territories. Therefore, if a state proceeds alone to survey and delimit its border areas, no juridical principle will apply the effects of such unilateral action to another state which, being directly interested, has not co-operated in any way in its execution or consented to accept its consequences. From the point of view of the non-participating state, the international boundary remains undefined.[18]

But so long as the border which India claimed to be pre-existing accorded to the perception held in Beijing, or was acceptable to the Chinese government, there should be no cause for conflict, although the Indian approach would rule out joint redefinition by diplomatic process. What would happen, however, if the boundary 'discovered' by the Indian government conflicted with China's understanding of the alignment of the traditional and historic frontier? And if a Chinese presence were found to be within what India claimed to be its anciently-established limits, but was asserted by Beijing as expressing China's own reading of history? Such a presence could only be regarded by India as adverse and illegitimate, and the trespassers would be asked to withdraw and expected to comply. Refusal would elevate the offence from trespass, to incursion, to aggression. Once the charge of 'aggression' was made public, politicians and press would take it up and demand armed action to repel the aggressors. Failure to respond would open the government to logically valid charges of surrender of national territory – and therefore military action against China would become an unavoidable political necessity.

Thus the package of linked policies evolved privily by Nehru and his advisers in the years immediately after India attained independence would, if consistently applied, promise to lead ineluctably to armed conflict on the Sino-Indian borders. The first overt expression of India's policy for the consolidation of its claimed border with China came in February 1951 when an Indian official party, escorted by a strong paramilitary column, marched into the Tibetan monastery centre of Tawang, proclaimed it to be Indian territory, and ousted the Tibetan administrators. In thus presenting an annexationist fait accompli to the authorities in Lhasa – as well as those recently established in Beijing – the Indian government was both continuing and modifying the policy towards the north-east frontier applied by their British predecessors.

The reassertion of Chinese authority in Tibet in the first decade of the 20th century – and its collapse in 1912 – led to an attempt by the British Indian government to replace the established and traditional limit of its administration in the north-east, which lay beneath the foothills of the Assam Himalayas, with a 'scientific frontier' that ran along the crest of the mountains, some 60 miles to the north.[19] Such a frontier projection would in effect annex some 60,000 square miles of territory which China regarded as its own, being an extension of Tibet, and which was depicted as Chinese on British official maps as well as China's. Most of that great tract was unadministered, occupied by tribal people who fiercely and effectively resisted intruders, whether from north or south; but a tapering salient of territory at its western extremity, running down to the plains from the monastery centre of Tawang, was administered, by Tibet's ecclesiastical authority.

Britain convened in Simla in 1913 a tripartite conference, including a Tibetan delegate and a representative of the Chinese central government, the ostensible purpose of which was to reform and regulate relations between Lhasa and Beijing. The foreign secretary of the Indian government, Sir Henry McMahon, used the occasion, however, to arrange secret, bilateral negotiations in Delhi in March 1914 in which the Tibetan representative was induced to accept the desired new border line. That line, which came to be named after the foreign secretary, was drawn on a map with an appropriate scale of eight miles to the inch, covering the sector from just short of Laos to Bhutan (the British then included Burma as part of their Indian empire). That map was not shown, of course, to the Chinese representative at the conference. But McMahon tricked him into initialling a different map, on a very small scale, which, while purporting to illustrate only a proposed division of Tibet into Inner and Outer zones, also incorporated McMahon's secretly-drawn alignment.

McMahon's actions at Simla exceeded his authority, and an American international lawyer and student of this history arraigns him for, among other sins, "lying at an international conference table and deliberately breaking a treaty between the United Kingdom and Russia".[20] McMahon's domineering chicanery was infructious, however. The Lhasa authorities repudiated their representative's actions; the Chinese government, suspecting what had gone on behind its representative's back, declared that any agreement reached between Britain and the Tibetan authorities would be illegitimate and null; in his report to London the Viceroy disowned McMahon's dealings with the Tibetans; and the home government tacitly expressed severe disapproval, it appears, by transferring McMahon out of India. Thus the 'McMahon Line' was stillborn [21] It was left to another imperial frontiersman serving the British government in India, a man very much in the McMahon mould, to breath life into it a quarter of a century later

In the mid-1930s Olaf Caroe, then a middling official in New Delhi, disinterred from the archives the documentation concerning McMahon's abortive border advance, and persuaded the British government to begin pretending that the McMahon Line was India's legal boundary, legitimated by the formal assent of Tibet and China – Caroe arranged a dip-

lomatic forgery to support the false assertion that the boundary had been agreed at the Simla conference.[22] Consequently in the 1940s some British maps began showing the McMahon Line as the boundary, qualified only with the wording, 'Undemarcated' (that is, still awaiting agreement on its exact alignment and marking out on the ground by joint process of the two neighbours). During the war and immediately after it the British began the task, difficult and dangerous (because of tribal hostility), of extending their administration towards their claimed border. Those forward movements immediately drew strong protests and demands for their withdrawal from the Chinese government, then Nationalist. Those protests were repeated, redirected to the incoming Indian authorities, in early 1947; and in 1949 the Nationalist government, although by then in extremis, still delivered in New Delhi a formal note again repudiating all documents emanating from the Simla Conference.

By the time India became independent in August 1947 the British had made some progress towards making the McMahon Line good on the ground as India's north-east border, in defiance of China's protests; and the successor government in New Delhi took up the task of completion.

Against that historical background the new government of independent India cannot be criticised for continuing an inherited policy, and maintaining the British claim to a boundary on the McMahon alignment, although the wisdom of attempting to sustain and use Britain's supportive falsehoods and forgery is questionable. On the other hand, Britain's policy on the limits of its imperial possessions reflected great power, often indeed supremacy; and even so, the British always showed a politic awareness that it was advisable to take full account of a neighbour's sensibilities when trying to fix borders, and that force exerted on the ground needed to be balanced by pragmatism and diplomatic finesse. It is not easy to imagine a British government adopting such a provocatively obdurate tactic as Nehru was to apply in this instance: that if the new China questioned the legitimacy of the McMahon Line, as had the old, India would simply refuse to discuss the subject.

The forceful reassertion of Chinese central authority in Tibet that began in November 1950, seen by many in India (and elsewhere) as an invasion, galvanised the Indian government into alarmed activity. (Dispatch of an Indian expeditionary force to Lhasa, in the steps of Younghusband, to pre-empt or resist the PLA, was seriously considered.)[23] The prospect of a Chinese military presence, at least potentially hostile, along what the minister responsible for its defence, Sardar Patel, recognised to be the 'undefined' northern frontier[24] added a new dimension to India's perceived threat horizons. After urgent consultations, plans were laid for the rapid extension of administrative and defence arrangements in the north. On 20 November 1950 Nehru proclaimed in the Indian parliament that the McMahon Line was India's border with Tibet in the north-east, reiterating the British falsification about its having been "fixed by the Simla Convention of 1914". He conceded that China's maps showed a contrary border line, well to the south, and had done so "for the last 30 years"; but, he went on, '[Chinese] map or no map', the McMahon Line was India's boundary, "and we will not allow anybody to come across [it]". That forthright declaration was the first public articulation of India's unilateralist approach to the problem of boundary settlement.

In annexing Tawang three months later the Nehru government exceeded its predecessors' ambitions and intention. McMahon had drawn his line to bring Tawang into India, but even in Caroe's time the government had second thoughts about that. To begin to take over the tribal tracts which China, although claiming them, had never administered, was one thing – those comprised, in imperial terms, a no-man's land; but to annex a tract which since they first contacted it the British had recognised as administered Tibetan/Chinese territory, was quite different. Therefore during the years of the second world war the British engaged Lhasa in discussions looking to the re-drawing of McMahon's alignment so as to leave Tawang, with its great monastery, to Tibet. They tried to present that proposal as a magnanimous concession, seeing it themselves as a 'sop' which might induce Lhasa to accept the rest of the McMahon alignment as the border. They failed. The Tibetan authorities would not bite.[25] Indeed upon India's achieving independence Lhasa dispatched to New Delhi a formal request that the new post-imperial government withdraw all its predecessors' intrusions into the territory between the McMahon Line and the traditional border beneath the foothills.

Lhasa vigorously protested India's seizure of Tawang, and again made clear that Tibet regarded the McMahon Line as a chimera, without validity as a boundary. From Beijing, however, came no comment, although by then the PLA had established itself in Lhasa, its advance units cannot have been far from Tawang, and the Chinese government appears to have received prompt reports of the Indian action.[26] That silence was the first indication that the new men in power in China were willing to accept McMahon's boundary alignment as he drew it, along with other distasteful bequests from the period of China's prostration. Further evidence to that effect followed, again expressed in silence – and this appeared conclusively to confirm intended acquiescence. The People's Republic might have been expected to continue and intensify the protests which its Nationalist predecessor had vigorously been issuing over the British and more recently Indian advances into NEFA; but in the event Beijing ignored the Indian government's accelerated military and administrative thrusts up to the McMahon Line. (As will be seen, the Chinese did react, however, when Indian personnel pushed northward across the Line.)

After India's incorporation of Tawang the frontier fell quiet again, while the two neighbours built up their internal communications, building roads, sending out patrols and survey teams, establishing posts – and thus moved closer to impingement. Diplomatically, the next event was the holding in 1954 of negotiations on trade and intercourse across the Tibetan sector of the Sino-Indian border, which looked among other matters to the terms of India's surrender of various rights and privileges which the British had induced Lhasa to grant, including maintenance of armed personnel within Tibet. As the Indian government prepared for those negotiations its basic policy towards border consolidation, which might be summarised as "lie low and say nothing about the borders but make good our claims", was reconsidered, but only to be confirmed. As a key participant in the discussions put it:

> The general view was that we should not allow China to take this opportunity to rake up the whole issue [of the borders]. In any case, China was not going to recognise the McMahon Line which we considered to be our northern frontier and so there could not be any negotiations on that score.[27]

Therefore "it was decided that the question of the frontier would not be allowed to be raised, as in India's view this was well settled by custom, tradition and useage. If the Chinese raised it, the Indian side would refuse to discuss it".[28] That decision was challenged within the government, at high level, but Nehru stood fast on the strategy he had chosen: that the subject of the borders should be left to China to raise, and if or when it did so, "We can plainly refuse to reopen the question and take our stand [on the position Nehru had stated in Parliament],

that the territory on this side of the McMahon Line is ours, and there is nothing to discuss' about it".[29] In the event the Chinese side in the negotiations did not bring up the question of borders either, although it did intimate that it considered that to be a subject to be discussed on another occasion.

The Agreement on Trade and Intercourse in Tibet which issued from the negotiations enshrined in its preamble the "Five Principles of Peaceful Co-existence", the first of which was "Mutual respect for each other's territorial integrity and sovereignty"; and the Indian government seized on that principle as foreclosing any future challenges from Beijing about its border claims. By that time it had completed its secret and unilateral investigations and decided upon the alignment of the borders with China. In July 1954 Nehru circulated a memorandum on the Sino-Indian borders to ministries concerned, describing the Tibet treaty as "a new starting point of our relations with China and Tibet". He went on:

> Both as flowing from our policy and as a consequence of our agreement with China, this frontier should be considered a firm and definite one, which is not open to discussion with anybody. A system of checkposts should be spread along this entire frontier. More especially, we should have checkposts in such places as might be considered disputed areas.[30]

That 'firm and definite' border appeared in new maps issued at about this time by the official cartographer, the *Survey of India*, and it was very different from what had been shown in previous maps. Those generally had reflected the actual position, as stated by the home minister, Patel, that when India became independent the Sino-Indian frontier was undefined. As noted above, the McMahon Line had begun to be marked on British maps after 1940, replacing a border alignment which had matched that shown on Chinese maps, running along the foot of the hills; but then the McMahon Line was still qualified as 'Undemarcated'. The new maps showed it as a full and final international boundary. To the mortification and concern of their rulers, Bhutan and Sikkim were shown as included within India's boundary. But it was in what became known as the western sector of the Sino-Indian border, where the state of Jammu and Kashmir marched with a corner of Sinkiang and with Tibet, that the greatest change appeared. There a new boundary line, categorical in depiction, looped up to the north-west from the Karakoram Pass to the Kuen Lun mountain range so as to include within India a tract of territory comprised for the most part of the Aksai Chin plateau.

At India's independence the situation in the western sector was unchanged since the Foreign and Political Department of the Government of India, in its official publication of record, generally short-named as *Aitchison's Treaties*, stated in 1931 that "The northern as well as the eastern boundary of the Kashmir state is undefined".[31] In the north-east the line India claimed as its boundary had at least a pseudo-diplomatic basis in McMahon's 1914 subterfuges, and a fairly precise cartographic expression.[32] But the boundary now claimed in the western sector had no foundation other than that it had been proposed and considered as a possible claim-line – and rejected – within the British Indian administration, as had a number of alternative possible boundary alignments for that sector, all markedly less advanced than the line chosen. As the outstanding Indian analyst of this history put it, "the Indian claim to Aksai Chin had no basis in treaty, usage or geography".[33] It was not until five years after the issuance of the new maps that an official was sent to London to devil up a case for the Aksai Chin claim from the archives. He managed to do so, with the aid of a critical falsification, of which his government made much use.[34]

If, as Nehru had ruled, nobody (which is to say, China) was to be allowed to question the wildly irredentist claim now cartographically advanced for Aksai Chin, then India's border policy had become wholly inimical to Nehru's often stated wish for India's close and friendly relations with China, and to that extent contradictory, even irrational.

But how solid was Nehru's often voiced aspiration for friendship with China? Much has been made of his repeated expressions of friendly and positive regard for China during this period of the 1950s, when slogans about Sino-Indian brotherhood were shouted by Indian crowds welcoming official visitors from China, and certainly he made India an open and active supporter of the People's Republic's international interests at that time. Consequently there has been readiness to accept his and the wider Indian perception and portrayal of the 1962 border war as an act of perfidy by Beijing, a treacherous betrayal by a friend. But an underside to Nehru's approach to China, one marked by suspicion, animus, and territorial acquisitiveness, has been illuminated since that time. The light was shone not by a critic but by a man whose admiration for the prime minister was unqualified, even adulatory, and who was a close and influential adviser through almost the whole of Nehru's time in office – N B Mullik, director of the Intelligence Bureau (IB), which in 1931 was given responsibility for foreign as well as domestic intelligence.

Mullik, who described himself as a Bengali-speaking Bihari (his name is Bengali and apparently he did not wish to be taken for a Bengali) served in the Indian Police Service (IPS) for more than a decade before India's independence. His first contact with Nehru, in 1934, led to his receiving a nasty snub from the then Congress leader, who of course held a low opinion of all members of the IPS, especially Indians thus acting as enforcers for the raj – and that rankled with Mullik for years.[35] But when, after independence, he joined the Intelligence Bureau, becoming director in 1950, the old slight was forgotten, and as is clear in his most revealing trilogy, *My Years With Nehru*, Mullik came to revere the prime minister, personally and as a statesman. Nehru, it is also clear, not only from Mullik's account but from the influence, even power, the IB came to exercise on those aspects of government policy which Nehru dominated, responded with full trust in Mullik's percipience and judgment.

In Mullik's account, when in 1952 he sought from Nehru guidance as to India's strategic orientation, and therefore the prime targets for the attentions of the IB, he was instructed that China must be counted as one of 'two enemies', the other being Pakistan. He was therefore told to lend all support to anti-Beijing Tibetan emigres, "to help them in every way possible and maintain their morale".[36] Mullik was one of those who had urged dispatch of an Indian expeditionary force to forestall and oppose Chinese occupation of Tibet, and he quickly built up supportive relations with the Dalai Lama's brother and other members of the Tibetan oligarchy who had fled to India upon the arrival of the PLA in Lhasa. This must have brought him into co-operative contact with the CIA, whose agents were working from about 1956, with Indian connivance at least, to foment the revolt in Tibet that broke out in 1959.[37]

According to Mullik, Nehru foresaw that conflict with China over the borders was inevitable, and played for time. Therefore he maintained his posture of friendliness, which was also partly genuine, to lull China into a sense of security while India made good its border claims. Nehru went some way towards confirming that interpretation himself, after the dispute became a public issue in India, in defending his tactics in Parliament. The government had been alive to the problem of the northern borders from 'the very first day' (presumably, of its existence), he said. It was decided not to raise the issue

with China but rather to make it clear, in maps and statements, where India placed its borders: "Why should we go about asking China [and raising] this question when we felt sure about it? ...We felt we should hold by our position and that the lapse of time and events will confirm it, and by the time, perhaps, when the challenge of it came [from China] we would be in a much stronger position to face it".[38]

Because border protection was the responsibility of the home ministry, under which the IB operated, it was in giving effect to Nehru's policy in that regard that Mullik's influence was most potent and extensive. Implementation of Nehru's directive that a system of checkposts be established right along the border, and "more especially...in such places as might be considered disputed areas", was Mullik's responsibility, one which he said he 'pursued ... with single-minded effort'.[39] His account of that project merits quotation at length:

> In setting up the checkposts all along the frontier, as we then understood its location, we often came in conflict with both the Army Headquarters and the ministry of external affairs. We were often accused of going into disputed territory or trespassing beyond our border though, except that some of our patrols did sometimes cross into Tibet or Sinkiang due to the faulty nature of the maps, we had located the checkposts within our claimed frontier. If we went too near the frontier, we would be accused of causing provocations. We did not give in and our contention was that as the responsibility for guarding the frontier had been given to us, we were free to open the posts wherever we thought they would serve us best.... Moreover, once we claimed a territory to be our own, we were free to go and open our post there, no matter whether the Chinese disputed our claims and raised protests.[40]

Mullik knew he was armoured against the army and external affairs by Nehru's unwavering support.

> We were always quite confident that finally when the dispute [within the government] was referred to the prime minister he would decide in our favour because we were only carrying out the orders specifically given by him to me.... This is what happened on more than one occasion when the army headquarters or the external affairs ministry reported against us to the prime minister. The file came back with the note that as we had already opened the post we need not withdraw from it but we should be careful to see that we did not trespass into Chinese territory.[41]

Sometimes, Mullik admitted, his patrols did encroach onto what he conceded to be Chinese territory, once 40 miles into Sinkiang; but even on that occasion, when "the External Affairs Ministry was very angry", the prime minister commented that the patrol party must have been led astray by faulty maps. "And so further trouble [for the IB] was averted."

But so difficult was the terrain for India in the western sector, so very far-flung its border claim there, that it was to be several years before Mullik could push his patrols into contact with the Chinese in that sector. He succeeded at last in October 1959, when a long-distance patrol he had specially organised to set up a new post on 'the international frontier', as Mullik called the Indian claim line, was intercepted by a Chinese force near the Kongka Pass. In the ensuing firefight the Indian patrol suffered – nine killed, with the survivors being captured. That clash brought Nehru's support for Mullik's actions under its severest strain. At a top-level meeting the IB was accused by the army and foreign office officials of acting as 'aggressors and provocateurs'. The army insisted that no further movements of Mullik's armed police should take place along the frontiers without prior military clearance, "and the prime minister had to give in to the army's demand". The result, Mullik regretfully recalls, was that "the protection of the border was thereafter handed over to the army and all operations of armed police were made subject to prior approval of the army command".[42] In a bizarre inversion of actuality, typical of the deceptions being spun by New Delhi in those days, the army's assumption of responsibility for the borders was presented as evidence of the seriousness with which the government viewed the 'Chinese threat'. In fact that it was a measure to protect China from the provocations Mullik, with Nehru's support, was bent on continuing and which, the army recognised at that time, must draw it into a conflict it could only lose.

The inhibition on forward Indian patrols into Chinese-held territory was not to last long, as it turned out. Sweeping changes in an army headquarters corrupted by political interference and favouritism, with courtier-soldiers replacing old-guard professionals,[43] meant that by the summer of 1961 the army itself had launched onto a 'forward policy' and was advancing troops into Chinese-held territory in the western sector to implement India's claims, regardless of Beijing's protests and warnings and reckless of the PLA's overwhelming superiority in weaponry, numbers and logistics. The aim of this hare-brained scheme, misbegotten by military adventurism out of Gandhian satyagraha (soul force), was somehow to extrude the Chinese from Indian-claimed Aksai Chin – to make them leave without actually forcing them out.

The rehearsal, or tuning up, for the collision for which Nehru had set the course had come in the middle sector of the frontier, as it came to be called, beginning with a mildly worded protest note from the Chinese government in July 1954 about an intrusion by an armed Indian patrol. What had happened in that sector, it appears, was that the Chinese, backing up the Tibetan position on the lie of the traditional border, had consolidated a 'scientific frontier'. That is, they claimed, and controlled, not only the mountain passes, but small trans-montaigne tracts as well. Through 1954, 1955 and 1956 there was patrol friction in the area, with continuing exchange of diplomatic protests, until discussions were opened between the two governments. Those were infructuous. An ominous tone was struck by India in a note late in 1956 in which a Chinese armed presence on the Indian side of a pass claimed by New Delhi to mark the frontier – an assertion denied by Beijing – was described as 'aggression'.[44]

The border dispute proper surfaced when China publicised the completion of a motorable road across Aksai Chin, linking Sinkiang with western Tibet. The Chinese described that notable engineering feat in an article on the achievements of their first five-year plan in the July 1958 issue of *China Pictorial*, and showed it on a map. The road construction had been noted while it was in progress by the IB and Mullik had urged establishment of army and armed police posts to monitor or impede it. But, in Mullik's account, at a meeting in January 1959 he was overruled by the army, with the support of the ministry of external affairs (MEA). The army's view, expressed by the then chief, General Thimayya, was that the road did not constitute any strategic threat to India and that the establishment of military posts in that area was beyond the army's logistical capacity and that anyway it would be folly to try to engage China militarily in this area. The reasoning of the ministry was that:

> this ... territory was useless to India. Even if the Chinese did not encroach into it, India could not make any use of it. The boundary had not been demarcated and had been shifted more than once by the British. There was an old silk route [across it] which ... the Chinese had only improved [to make their road]. It would be pointless to pick quarrels over issues in which India had no means of enforcing her claims.[45]

An Indian patrol was dispatched to check the lie of the road when spring made that possible, however – and nothing was heard

from it after the end of August. Then, on November 3, New Delhi was informed that the patrol had been detained, and its personnel deported. The Chinese asked for a guarantee that there would be no more such 'unlawful intrusions', and warned that those were inconsistent with friendly relations.[46]

The construction of the road and the arrest of the patrol demonstrated that the Aksai Chin was solidly under Chinese control and administration, and practically beyond India's purview. But the official Indian maps issued from 1954 showed the territory crossed by the road as unquestionably Indian. Now the impasse to which Indian policy had from its inception inexorably been directed was reached. Either the Indian government was going to have to resile from its absolutist and unilateral approach to border settlement, or the Chinese government would have to withdraw from what was for them a strategically vital tract, which it considered to have long been Chinese territory. So an irresistable force, or anyway an unassuageable demand, had met an immoveable object.

At about the same time as the reconnaissance patrol was dispatched to investigate the road the ministry of external affairs, in reversal of the approach it had advocated a few months previously, sent a formal complaint to Beijing – not about the road itself but about the international borders shown in the map with the *China Pictorial* article about it. Those, the note pointed out, did not coincide with the border of India as shown on India's latest maps. (The little sketch map in the magazine put China's boundaries along the Karakoram range in the west and the edge of the Brahmaputra valley in the east, as most maps issued in China had long shown them – and all now still do.) Nehru, this note of August 21, 1958 recalled, had alluded to just such cartographic contradictions in discussion with Zhou Enlai when he visited China in 1954 and had been reassured that "current Chinese maps were based on old maps" and that the People's Republic "had had no time to correct them". But the PRC had now been in existence for 'many years', and India "trust[ed] that the corrections [would] be made soon". The note concluded with an offer, which seems deliberatively offensive, to send a free copy of the latest Indian official map to guide Beijing's cartographers.[47]

In the historical context and the political circumstances of the time, that note is astonishing. Its peremptory tone would still have been out of place if addressed to the ruler of Sikkim or Bhutan, and its political implications were huge. In effect, it required China, through changes in its maps, first, to ascribe *ex post facto* legitimacy to McMahon's covert dealings with the Tibetans, thus imputing to the latter treaty-making rights and by implication sovereignty; second, to concede that the Aksai Chin tract was Indian territory, and therefore that the Chinese administration and development there amounted to 'unlawful intrusion'. And it was soon to be proved that the position taken in this note was by no means an opening bid calculated to leave plenty of leeway for diplomatic bargaining: the Indian government was advancing a non-negotiable demand.

Beijing's reply merely restated what Zhou had told Nehru: China's maps of the day were based on those authorised by the nationalist government and it would not be appropriate unilaterally to alter their depiction of boundaries. That must await surveys and the outcome of consultations with the countries concerned. In December 1958 Nehru himself joined the exchanges with a letter to Zhou Enlai, opening a personal correspondence which was to parallel formal diplomatic exchanges through the mounting conflict.

Nehru's tone was cordial, though the iron fist showed in some passages through the velvet. Referring back to the maps which had been complained about, he feigned surprise, claiming that he "had not been aware at any time previously that there was any frontier dispute between our two countries". He recalled Zhou's assurance at their meeting in 1954 about reproductions of old pre-liberation maps, but said that the "continued issue of these incorrect maps" nine years after the PRC's inauguration was 'embarrassing'. About the McMahon Line, Nehru reminded Zhou that they had discussed that sector in 1956, in the context of boundary negotiations then in progress between China and Burma, and that Zhou had assured him that China 'proposed to recognise this border with India', as it was doing in the case of Burma. The nub of Nehru's letter lay in this sentence: "There can be no question of these large parts of India [shown as within China on Chinese maps] being anything but India and there is no dispute about them".

Zhou replied promptly, in January 1959. In summary his points were: (1) The Sino-Indian boundary had never been formally delimited. That is, no treaty or agreement on the boundary had ever been concluded between the Chinese central government and a government of India. (2) "Border disputes [did] exist between China and India", and therefore it was unavoidable that there would be discrepancies between their respective maps. (3) The Aksai Chin area was China's and had "always been under Chinese jurisdiction". (4) The McMahon Line had no legitimacy as an international boundary but China was likely to accept that alignment at the appropriate time and circumstances, as it was doing in the negotiations with Burma. There, already, can be foreseen the outline of a possible settlement: China would legitimise the McMahon alignment as the boundary in India's north-east, while India waived or sharply modified its claim to Aksai Chin. But the path to that resolution could lie only through negotiations, for which, Zhou said, Beijing was now preparing.

Noting the recent friction between patrols in parts of the border, Zhou concluded with the proposal that 'as a provisional measure, the two sides temporarily maintain the status quo, that is to say, each side keep for the time being to the border areas at present under its jurisdiction and not go beyond them'. This was the measure that China saw as the essential preliminary to negotiations, which otherwise would be jeopardised or poisoned by public reactions to armed clashes in disputed areas. In Nehru's view, however, to come to such an agreement would be to acquiesce in, even condone, China's 'aggressive' occupation of Indian territory, and thus tacitly legitimise it. The alternative was to retain the option to use force, when it became available, to assert India's claims. (It was to be nearly 40 years before an Indian government would have second thoughts about Nehru's position, and accept the Chinese proposal.)

Outright rejection of Zhou's proposal by Nehru would have unwelcome consequences, however. It would amount to an implicit declaration that India would insist on advancing its forces into all territory it claimed; and while precisely that intention was central to Nehru's policy it would, if stated openly, expose a bellicosity at odds with India's pacific international posture and reputation, as well as prompting immediate defensive measures by China. Therefore in his reply in March Nehru prevaricated, introducing the casuistry that more and more was to mark the Indian diplomatic argument. He wrote:

> I agree that the position as it was before the recent disputes arose should be respected by both sides and that neither side should try to take unilateral action in exercise of what it conceives to be its right. Further, if any possession has been secured recently, the position should be rectified.

Thus Nehru, while appearing, at a first reading, to accept Zhou's proposal, in fact rejected it. His second sentence, contradictory to the first since it looked to res-

toration of what the Indian side judged to be the acceptable status quo ante rather than the maintenance of the status quo which Zhou had proposed, fore-shadowed what before long would harden into Indian insistence that China must 'vacate its aggression' by withdrawing from Aksai Chin before there could be negotiation. As Nehru put it in his next letter (26 September 1959): "No discussion [between the two governments] can be fruitful unless the posts on the Indian side of the traditional frontier now held by the Chinese forces are first evacuated by them ....". There by, in effect stipulating that China would have to reverse its position, at least suspend its claims, and evacuate the territory claimed by India before negotiations could begin, Nehru blocked any possibility of a peaceful, negotiated resolution of the dispute. In the near-40 years since then, no successor government in India has been able – or has sought – to overcome that impediment.

As had been the case in India's refusal to come to a stand-still agreement along the border, this refusal, in effect, to submit the dispute to negotiation could not be openly stated, since India was known as an insistent advocate of peaceful negotiation, without any setting of pre-conditions, in all international disputes.[48] Therefore casuistry was invoked again, and the Indian refusal to negotiate was masked in the diplomatic exchanges, which were in effect encoded with semantic obfuscation to give the impression that the refusal was China's.[49] Nehru was personally involved in the drafting of the most important of the diplomatic notes, memoranda and letters.[50]

The clash at the Kongka Pass, which caused an angry public outcry in India (much to Mullik's satisfaction),[51] brought Zhou Enlai to urge an immediate summit meeting. Nehru stalled for some months but then agreed to receive Zhou Enlai in New Delhi in April (1960), making it clear domestically that the meeting was not for 'negotiations' but only for 'talks'. (He drew that distinction explicitly, and used it to fend off the critics who suspected he intended to surrender to what he had himself presented as 'Chinese aggression'.) Zhou Enlai nevertheless came to the summit meeting optimistic because he had recently signed an agreement with Burma, resolving border problems older and far more complex than those with India, and legitimising that section of the McMahon Line which covered the Sino-Burmese border.[52]

At the summit meetings China's proposal for settlement was made explicit for the first time: "reciprocal acceptance of present actualities in both sectors and constitution of a boundary commission".[53] This meant that the Chinese were prepared to formalise the McMahon alignment if the Indians dropped the claim to the whole of Aksai Chin and negotiated a mutually acceptable boundary in the western sector. An alignment proposed by the British to China in 1899, leaving the road well inside Chinese territory but providing for a marked advance for Indian possession, would have provided a good target for Indian negotiators. But Nehru's position was adamant: no compromise, no standstill agreement, no negotiations. Only China's diplomatic surrender and a promise to withdraw from Aksai Chin would have met the Indian demands.

Steven Hoffmann, the American scholar whose linkage of India's border policy to the nature of its elite's nationalism is cited above, offers an insight into the mindset of Nehru and his advisers when they received Zhou and the Chinese team. They-

> perceived in the Chinese wish [to negotiate a boundary settlement] an attempt to denigrate the historical authenticity of the Indian nation. A true nation would not, in the Indian view, be asked to negotiate its historically evolved borders. That request or demand could come only from a neighbour who (like India's former British rulers) regarded the Indian nation as an artificial creation.[54]

Thus in Hoffmann's analysis the more the Chinese side pressed for negotiations the more affronted were the Indians at what they felt as an impugnment of their very national identity, and therefore the more determined their refusal. Hoffmann's explanation derives from years of interviews with those who were Nehru's closest advisers at that time and, bizarre as it sounds, rings true.

Diplomatic exchanges continued after the failed summit, official teams of the two sides producing detailed statements of their historical and geographical arguments. But the deadlock was now complete and the accelerating implementation of India's 'forward policy' in the summers of 1961 and 1962, with consequent confrontations and, later, gunfire clashes, brought war steadily nearer. Nehru, while (in another context, that of India's annexation of Goa) saying that his "whole soul react[ed] against the thought of war", was phlegmatic, indeed insouciant, in openly discussing the prospect of war with China. That confidence seems to have reflected the fact that his closest advisers, especially Mullik, were ready to the last to assure him that China would never use force against India, and that Beijing's increasingly heated warnings were bluster and bluff. It also expressed, it seems, what a contemporary Indian observer called his country's 'great power complex'.[55] Nehru's vision of a Sino-Indian conflict was apocalyptic, he thought of a war that in its intensity and duration would shake the world. His premise, that India and China were powers of equal strength and resolution, was to be belied by India's total and immediate collapse under the shock of China's blows.

Rationally, if the forward policy were left out of consideration, the belief that China would never attack India was well founded. Such action would, indeed, be most invidious for Beijing, and it was difficult then – as it is now – to see any possible strategic or political advantage that China could hope to draw from hostilities with India. But by the beginning of the 1960s the PRC had begun to feel seriously threatened. The friendly strategic alliance with the USSR was breaking up; the nationalist rump on Taiwan, which American influence kept in China's seat in the UN, was intensifying its armed forays against the mainland; in a programme that had begun in 1956[56] the CIA was continuing to train, arm and transport rebel groups into Tibet, and trumpeting the cause of the Dalai Lama, by then in exile in India.[57] Not surprisingly the Chinese suspected the same influence was behind the military provocations which India was mounting (and certainly Mullik maintained close contact with the CIA station-head in New Delhi.)[58] What else, they might have asked themselves, could explain an Indian policy that could yield no material benefit to India but if continued must become at the least a worrying distraction for China's defence forces? So a military response to close off the threat from India inevitably came under consideration in Beijing, and precautionary force deployments began to be made.

By October 1962 the forward policy had created great tension in the western sector. Numerous small Indian army posts had been set up in Chinese- claimed and-controlled territory, and all had been closely confronted by the PLA, always in superior force. Armed clashes had occurred, the Chinese had suffered casualties. Beijing's protests and warnings that China's forces would be forced to retaliate had become angry and explicit. Then the Indian government resolved the issue for the Chinese leadership, removing any doubt about its intentions. A note dated October 6 was read in Beijing as "finally categorically shut[ting] the door to negotiations". Then Nehru, speaking to journalists on October 12, made a public declaration that the Indian army had been ordered to 'free our territory', that is, to take the offensive to implement India's claims. Nehru's handling of the dispute had by that time

made this statement politically inescap-able for him: what else could his government do but order attack if, as he had said was the case, China had deliberately invaded Indian territory? His bravado aroused jingoist jubilation among the Indian political class and satisfaction in the west, where the statement was taken as an ultimatum, even a declaration of war[59] – but horror among the commanders in the field whose troops would have to execute the Balaclava-like orders.

Nehru's commitment referred to a confrontation which had developed on the McMahon Line – or rather, to be precise, on the Chinese side of the McMahon Line. The map on which McMahon had drawn his line was based on an elementary survey, and when in the 1950s Indian administrators reached the frontier area they concluded that in certain sections McMahon should have placed it several miles further north. Since the Chinese were carefully observing the line as McMahon had drawn it as the de facto border, calling it 'the line of actual control', it was clearly in India's interest that nothing be done to disturb the situation in that sector. With every year that passed China's observance of the McMahon Line served to strengthen India's claim. Nevertheless, as soon as they were able to do so the Indians began setting up outposts in several sectors to the north of the McMahon Line as McMahon had drawn it, maintaining that it was their right to make such unilateral 'corrections'. Since Beijing baulked at this 'nibbling at Chinese territory', as Deng Xiaoping later described it, the result was a protracted series of armed confrontations, beginning with a clash at Longju in August 1959 and continuing to the present.

The only strategically significant patch of territory claimed by India north of the line as McMahon had drawn it lay at its western extremity, where an Indian position on the highest local feature, Thagla Ridge, would give the outpost overview of a Chinese base and communications. In June 1962 the Indian army, acting on orders originating from Mullik to occupy the Ridge, established a post on the Namka Chu, a mountain stream running along its foot – the crest was beyond the troops' logistical reach. In September the Chinese reacted just as they were doing in the western sector, confronting the new Indian post with a superior containing force. The Indian government then proclaimed that it was the Chinese who had sent forces across the McMahon Line, and Nehru made his public vow to have them thrown back.

The Indian army was struggling against agonising difficulties to get even lightly armed infantry to the area – all weapons and supplies had to be man-carried over steep ridges at altitudes lethal to its unacclimatised and under-clad troops: the PLA, its heavy weapons and supplies, were transported by truck to just behind Thagla Ridge and then by mules across it. To drive the Chinese off the ridge by assault was a military impossibility, even after the Indians had managed to concentrate a brigade of infantry – indeed any Indian concentration could easily be outnumbered by the Chinese. The divisional commander whose troops would have to obey the order and launch a hopeless attack recalled his reaction to hearing Nehru's statement on the radio news:

> The statement hit me like a bludgeon. I found it hard to believe that any responsible person let alone a statesman of international repute could publicly make such an irresponsible operational pronouncement.... The military implications and the likely Chinese reaction were clear, at least to us up at the front. If Nehru had declared his intention to attack, then the Chinese were not going to wait to be attacked.[60]

On October 9 the Indian troops had made a tactical move preliminary to an assault on the ridge. That foolhardy sally was promptly driven back, but not before the Indians had inflicted heavy casualties on the Chinese. A few days later another battalion struggled down onto the river-line to reinforce the Indians, bringing their number to about 2,500. The deployment of the Indian troops was as if for attack, not defence. Thus there were no grounds for doubt in Beijing that Nehru meant what he said, and that an Indian assault on the Chinese positions was imminent.[61] Nor was there any doubt that such an assault could be repulsed, with massive losses among the attackers and minimal Chinese casualties. But Beijing must have appreciated that such a localised victory would only have worsened China's problem. The Indians' defeat would have augmented their complaints of victimisation and charges of Chinese aggression – which were being believed in the west – and determined them to fight again as soon as they were strong enough. Only a punitive blow on a far greater scale could be expected to deter India from continuing its attempts to make good its border claims by force.

Before dawn on October 20 the PLA launched a pre-emptive offensive, and the border war began.[62] The Indian troops beneath Thagla Ridge fought while their ammunition lasted, about 30 minutes, before they were overwhelmed, and the Chinese advance in the east continued until Tawang was re-occupied. The most advanced Indian 'forward policy' posts in the western sector were also wiped out. The Chinese forces then paused, and Zhou Enlai appealed personally to Nehru. He offered a ceasefire and withdrawal of the PLA to positions behind the McMahon Line, calling for India, in return, to end its forward probing and open negotiations "to seek a friendly settlement of the Sino-Indian boundary question". Nehru rejected the offer instantly. Three weeks later a second Chinese offensive took only three days to crush all Indian resistance in the disputed areas, in both the western and eastern sectors. Panicking, Nehru appealed for American military intervention in term so hysterical that the Indian ambassado delivering the message wept with humili ation.[63]

The PLA troops stopped their advanc when they reached China's claim lines Then China declared a unilateral ceasefir from November 22, and a month late withdrew its armed forces to positions 2 kilometres behind the McMahon Line.

Thus began and ended what prim minister Vajpayee described to presiden Clinton as "China's armed aggressio against India". The account and analysi above show that the border war of 196 was nothing of that kind. India created border dispute, refused to negotiate it, an then attempted to make good its claim by armed force. A military response wa imposed upon Beijing, and when it cam it was measured and appropriate. China' reactive use of force was justified, stra tegically and politically, indeed India policy had left Beijing no realistic alte native. As one Indian commentator put i "the catchphrase of [China's] 'unprovoke aggression' came to be peddled in th aftermath of the border war purely fo political reasons – it was a cold politic gimmick to win sympathy...."[64] But sinc that misrepresentation served as balm fo the deeply wounded pride of the India political class it was immediately accepte as truth, and has been a cherished delusio in India ever since. Vajpayee showed i his letter to president Clinton that th Indian government is still ready to see advantage from the old fiction.

II
Why the Dispute Is Still Unresolve

China's victory in the border war wa complete, India's defeat absolute, but a a continuation of diplomacy by other mear China's punitive expedition was onl partially, and temporarily, successful. Th Indian army's debacle led to a purge i headquarters. Only one or two of th courtier-soldiers survived in their careers:[6 the Indian army was returned to profe sional command and the political interfe

ence which had led it into the forward policy and to debacle was ended. The borders fell quiet, there were no more challenging Indian probes in the western sector or across the McMahon Line – for 25 years. But nothing changed in the government's diplomatic approach. Nehru's position was as adamant as ever and indeed now reinforced with an imagined sense of injury and betrayal as well as real humiliation. China's use of force had not accomplished conclusively and lastingly either of its two political objectives: to bring India to the negotiating table; and to show the Indians that pending such negotiations it would be futile and self-destructive to try to impose India's territorial claims on China by force.

Zhou, whose personal experience of dealing with Nehru had left him contemptuous and angry,[66] took off the gloves in terminating the prime ministerial correspondence, in April 1963. He accused Nehru of taking "a dishonest approach, which shows that India has no intention whatever to hold negotiations", and ended with a *tant pis*: "If the Indian government, owing to its internal and external political requirements, is not prepared to hold negotiations for the time being, the Chinese government is willing to wait with patience". Thirty-six years later, it is still waiting.

Beijing's approach has not changed since Zhou Enlai first expressed it at the 1960 summit meeting. One of its most explicit statements since then was given pithily in 1981 by Deng Xiaoping, when he received a member of the Indian parliament:

> China has never asked for the return of all the territory illegally incorporated into India by the old colonialists. China suggested that both countries should make concessions, China in the east sector and India in the west sector, on the basis of the actually controlled border line, so as to solve the Sino-Indian border question in a package plan.[67]

The position in which Nehru had impaled his government has made reversal, even adjustment, very difficult. His own and other politicians' rhetoric apart, during the border war parliament had passed a resolution binding the government – and its successors – to 'recover' all Indian-claimed territory occupied by China. The official maps issued so confidently in 1954 to illustrate the 'firm and definite' – and non-negotiable – Indian borders can be cited to argue that any compromise settlement with Beijing would involve ceding Indian territory. The constitution does not give power of territorial cession to the executive. Thus it can be argued that a constitutional amendment would be required before a treaty could be implemented, and in any conceivable political circumstances that would be extremely difficult to obtain. So even if any Indian government were prepared to brave a political storm by opening negotiations with Beijing with a view to settling the borders, the attempt would still meet the roadblock erected by Nehru.

Successor governments nevertheless stepped cautiously and slowly towards normalising relations with Beijing. Indira Gandhi, her father Nehru's near-successor, returned diplomatic representation to ambassadorial level in 1967. Under the Janata government in 1979 A B Vajpayee, then foreign minister, visited China, and after that visit low-level official discussions of the two governments' positions on the borders were re-opened, only to strand immediately on the basic contradiction – that what Beijing proposed to negotiate New Delhi held to be unnegotiable. Those meetings nevertheless sputtered on, and by the mid-1980s relations were on a steady and improving basis. Then in 1987 the border dispute was suddenly revived in an acute form, and turned again towards the arbitrament of force, a second round of India's China war.

As in the early 1960s, a change in army headquarters had placed in top command another soldier with a 'Napoleon complex'.[68] Earlier it had been Nehru's kinsman General Kaul, a lowly public relations officer lifted by the prime minister's favour to the lofty and too-demanding office of chief of the general staff, then corps commander charged with sweeping the PLA out of the territory India claimed. In the 1980s it was General K Sundarji, chief of army staff, another ambitious soldier and, again like Kaul, without combat experience in his record. He developed an Indian Ludendorff plan, looking to a conflict that would enable India to deploy its military superiority to render Pakistan a 'broken-backed state'. In 1986 Operation Brasstacks, the largest Indian military exercise held up to then, was mounted on the border with Pakistan – with the aim, as one analyst put it, of "creating a situation in which Pakistan would be compelled to attack".[69] Sundarji was denied the opportunity to put his plan into effect because the Pakistani government kept its head and refused to be provoked. He then turned his attention, and the army's weight, against China in the McMahon Line sector.

The situation in that eastern sector had become inflamed again by yet another outbreak of what may be called the 'Longju syndrome', after the site of the first armed clash on the borders: the Indians' insistence on a right to move into areas north of the McMahon Line wherever their appreciation of local topography suggested McMahon had drawn it too far to the south (they have never found sectors where he drew it too far north). As had been demonstrated since 1959 and crushingly in October 1962, China disallowed such unilateral adjustments and invariably confronted them. Nevertheless in 1985, when the spring thaw reopened the patrolling season for the Indians, a small detachment of the Special Services Bureau (SSB, established in 1963 as a border reconnaissance and intelligence unit) was sent forward to establish an observation post above the Sumdarong Chu (river). The site gave the post an overview of Chinese military dispositions behind Thagla Ridge; and so the new post was not only on the Chinese side of the map-marked McMahon Line, it was in an area of special significance and sensitivity since it had been the spark-point for the border war. In laying down the conditions for the PLA's unilateral withdrawal in 1962 Beijing had specified that the triangular tract of territory between the map-marked McMahon Line, the Bhutan border and Thagla Ridge was to be kept de-militarised, and reserved the right to 'strike back' if India moved into it.

The Chinese did not react immediately to the establishment of the new post, however, and it went unchallenged until the onset of winter when the SSB detachment withdrew. Investigating the vacated site, the Chinese noted that work had been commenced to make this an all-year-round post: they demolished those structures and built their own, clearing a helipad. On the SSB's return to resume the position in July 1986 they found the Chinese securely installed there. Word of that Chinese anticipation quickly leaked into the Indian press, with official spokesmen as usual portraying it as an unprovoked intrusion into Indian territory; and on August 8 the Indian government formally accused China of having deliberately sent forces across the McMahon Line. The Chinese pre-emption of the Sumdarong Chu site and denial of it to India was seized on by General Sundarji as a challenge which the army must take up, and a new exercise, Operation Falcon, was quickly organised on the basis of a regular map exercise, Operation Chequerboard, which had been scheduled for about that time. Operation Falcon was to confront China with a display of great offensive force on its border, as Brasstacks had with Pakistan.

So on the winding down of Brasstacks at the beginning of 1987 the Indian army began heavy troop deployments from west to east and south to north. Just as a beginning, three infantry divisions, although stretched and fatigued from their role in

airstacks, were moved across India into the McMahon Line sector. By April 1987 the Indian army had, in strength, taken up the positions beneath Thagla Ridge in which its battalions had been overwhelmed at the outset of the border war. The Indians established two strong points threatening the Chinese post on the Sumdarong Chu: Chinese forces were immediately deployed to confront them in two opposing posts only 7-10 metres away. The Indians made additional shallow advances across the McMahon Line at some seven widely separated points, bringing immediate Chinese responses and close-contact confrontations between the opposing troops. Thus Sundarji threw down the gauntlet.

By this time, after decades of intensive re-arming and expansion, the Indian army was very different from the weakly-armed, ill-clothed force that had been painfully mustered in 1962 to drive the PLA out of their commanding positions on Thagla Ridge and later, although in strong defensive positions, had crumbled without giving battle because of incompetent generalship. Not only were the Indian troops now well prepared and armed for warfare in this terrain, roadheads had been brought nearer the key frontier areas, and plenty of transport aircraft and combat helicopters were available to provide supply and ground-attack support. At the peak of the exercise India had deployed 12 divisions, with additional independent brigades, against the Chinese in the north-east. Ground support and fighter-bomber aircraft of the Indian Air Force (IAF) were brought into airfields in Assam and north Bengal: by one account from a reliable informant, five squadrons.

General Sundarji's calculation was that if the Chinese were drawn to respond as they had done in 1962 and used lightly-armed infantry to launch fast-moving, hard-hitting sweeps up to and around Indian positions, they could be stopped, surrounded and wiped out by superior Indian forces striking from prepared defensive bases – a tactic Sundarji called 'encirclement/annihilation'.[70] His strategy called also for limited counter-offensives into Tibet if the Chinese reacted in force, with the IAF in an infantry support role, extending, if necessary to ensure control of the air, to raids on Chinese air force bases in Tibet. Sundarji's battle scenario seems to have taken Viet Nam's successful resistance to China's invasion as exemplary: not long before he had led an Indian military delegation to Hanoi.

The Chinese did not react as they had done in 1962, however. They heavily reinforced in Tibet, inducting field forces from Chengdu and Lanzhou, with fighter-bombers and combat helicopters suited to operations at high altitudes. The leadership in Beijing was no doubt aware of the view expressed in official circles in New Delhi – to be fair, on their eccentric fringes – that India should advance its frontier to the Tsangpo River,[71] and therefore took no risks. In May, Beijing formally warned India of the serious consequences if it persisted in 'aggression'. There were unconfirmed reports at the time that the Indian army planned and prepared a divisional attack to clear the Chinese out of the Sumdurong Chu area; but twice, according to those reports, last-minute orders called off the attack.[72] Such an action would undoubtedly have re-ignited a full scale border war, perhaps something more; but in the absence of anything but pinpricks Beijing declined to be provoked into retaliation.

The Indian government's presentation of the confrontation as another consequence of China's aggressive encroachments onto indisputably Indian territory drowned out Beijing's more truthful account, as had happened in the run-up to the border war. But considering the explosive potential of this confrontation surprisingly little attention was publicly paid to it internationally.[73] Satellite observation gave Washington a grandstand view of everything that was happening, however, and the administration watched developments closely, from about March 1987. It appears that the Americans brought up the subject with the vice-chairman of the Chinese military commission, General Yang Shangkun, during his visit to the US in April, evoking the response that although China wanted a peaceful settlement it would have to react if India kept up its aggressive probings along the frontier. That reminded Washinton's officials of Deng Xiaoping's vehement criticism of India during the Beijing visit of Caspar Weinberger, then defence secretary, in the previous October when, according to the well-informed Washington correspondent of the *Far Eastern Economic Review*, Deng had "accused India of nibbling at Chinese territory and said that China would have to 'teach India a lesson' if this practice did not stop". When secretary of state George Schultz went to Beijing in March 1987 Deng repeated that warning about the potential consequences of India's actions, and advised the administration to take into account the anxiety caused among India's neighbours by American plans to provide India with high-technology defence equipment.[74]

The Americans did not like any of that at all. Long gone were those jubilant days when Washington's highest hopes (and deepest plans?) were fulfilled in India's great falling-out with China. Now such a conflict would be contrary to all the USA's political and strategic interests, and it can safely be assumed that the Indian prime minister Rajiv Gandhi was so informed. From Moscow Gorbachev had before this made it clear that the USSR wished to see good relations restored between New Delhi and Beijing, having himself taken the simple – but portentous – step needed to begin the resolution of the equally embittered and apparently intractable Sino-Soviet border dispute.

The confrontation eased with remarkable speed at the end of the summer of 1987, that anti-climax presumably reflecting a belated assertion of authority by the Indian prime minister or cabinet, in response to American warnings. New Delhi toned down its statements; and then extended an olive branch by seeking an invitation for prime minister Rajiv Gandhi to visit Beijing.

Flag meetings between local commanders of the opposing forces along the McMahon Line were arranged, leading to disengagement in some areas. The eyeball-to-eyeball confrontation of the four posts in the Thagla triangle continued however. Throughout the eastern sector the Indian army remained deployed in force in forward positions, giving its troops so another general of the Sundarji school was to opine in 1995, "moral ascendancy over the Chinese for the first time since their humiliation on these very mountains in 1962".[75] General Sundarji's tenure ended not long after this and he retired maintaining that the challenge he had mounted, and Beijing's passive response to it, had restored the morale the Indian army had lost in 1962, 'putting its tail up again'.[76]

Rajiv Gandhi's visit to Beijing in December 1988 did not lead to any breakthrough but the ongoing discussions on the border were raised to a higher level. Two years later prime minister Li Peng returned Rajiv Gandhi's visit. While again there was little to show from that summit meeting so far as the border dispute was concerned, behind the scenes progress was being made because the Indian approach had changed after Gandhi's visit, on the official level if not yet politically. One factor in that change was probably the aftermath of Sundarji's brinkmanship. The deployment of perhaps 60,000 troops in remote locations and extremely arduous conditions along the border (some estimates put the number at double that) put a heavy strain on the defence budget and was destructive to troop morale. But unilateral withdrawal of the bulk of the forces deployed on the China borders, even their significant thinning out, would

inevitably be assailed as retreat and surrender by the politicians, on the government as well as opposition side. If India's strained and distorted military posture was to be corrected it would have to be done under the cover of an agreement with China providing for mutuality.

Acceptance of Beijing's 40-year-old standing offer to open negotiations aimed at delimiting the boundaries and then jointly demarcating them continued to be unthinkable in New Delhi. But if Nehru's refusal to agree a stand-still on the borders could quietly be circumvented, some officials appear to have reasoned, the army's predicament could be resolved; and the line of actual control on the borders, if left undisturbed for decades or generations, might ultimately come in India to be considered negotiable. It was recognised however that an attempt to reach an agreement with Beijing that would allow military disengagement carried high domestic political risks, and so had to be approached warily and tentatively. So first the MEA sent up a trial balloon.

In August/September 1991 the Chinese vice-foreign minister, Qi Huaiyuan, visited New Delhi and held talks with officials and then with the prime minister, V P Singh. After Qi's departure Indian officials tipped off diplomatic correspondents that the meetings had produced a break-through – an agreement by which both sides would maintain the status quo along the Sino-Indian borders. The leak was displayed on the elite's notice-board, the main English-language newspapers, on September 2.[77] The implication such an agreement would carry in Nehru's terms, effective waiving of India's claim to Aksai Chin, was not recalled: the news was received calmly by politicians and press, even with satisfaction. But in fact the claim that an agreement to maintain the status quo had been reached was false. All that had been agreed in the talks were measures to facilitate communication between the two confronting forces on the border.[78] But that the trial balloon attracted no hostile fire must have encouraged the Indian officials who had floated it to press on, to try to enable the army to disengage, and to take a first step on the long road towards a boundary settlement.

Those efforts gathered strength when P V Narasimha Rao, a former foreign minister, became prime minister of a Congress government: he may have felt more freedom of movement than his immediate predecessors because the Congress Party had in 1988 resolved that India should seek a settlement with China based on "mutual interest" and "acceptable to the peoples of both countries".[79] Furthermore, J N Dixit, a widely experienced and activist diplomat, became foreign secretary and gave focus and fresh impetus to the feelers the MEA had been putting out to Beijing. By June 1993 a draft had been drawn up with the Chinese side. The prime minister approved it as the basis for final discussions to be held in Beijing during a summit visit scheduled for September; but in the interim he and Dixit held a series of meetings with political leaders in which they explained the reasons behind the government's approach, and argued that an agreement would be in the national interest. Approval was obtained, even from opposition parties – and the insistence that there be no leaks during that process was respected for once.[80] Consequently there was public surprise when, at the end of the meetings in Beijing, it was announced that an agreement had been signed "on the maintenance of peace and tranquillity along the line of actual control in the India-China border areas".

The agreement, on three pages and with only nine articles, is a model text, concise and clear. No-one familiar with the course of the Sino-Indian dispute could read it without reflecting how much conflict and destruction would have been avoided if in 1959 Nehru's government had agreed to Zhou Enlai's urging of just such a stand-still agreement. For the Indian side the essential passage, one that could have liberated Nehru too, is the caveat that "references to the line of actual control... do not prejudice [the two sides'] respective positions on the boundary question".[81]

In summary, the agreement provides that:

– Neither side shall use or threaten force.
– Both sides shall strictly respect and observe the line of actual control (LAC).
– Force levels on the LAC shall be reduced to "a minimum level compatible with... friendly and good neighbourly relations...."
– The parties shall work out, in a reinforced joint working group, how to achieve those ends.

Narasimha Rao's careful preparation of the political ground bore fruit, and there was no outcry in India against the agreement. That in effect it demolished one of the twin pillars of Nehru's border policy went unremarked.

The agreement, which like that of 1954 opened with an invocation of the 'Five Principles' of peaceful coexistence, looked to drawing the dangerous friction along the border out of the dispute and opening the way to a Sino-Indian detente, enabling incidentally a strategic re-deployment by the Indian army. But the rub lay in its implementation, which had to begin with agreement on the exact alignment of the LAC. Insistence by the Indian side on retention of the petty and strategically meaningless territorial acquisitions made during Sundarji's adventurist exercise meant that that became a vexed and protracted process, still continuing.

It was understood by both sides in the 1993 summit negotiations which clinched the agreement that the first task thereafter must be to disengage the dangerously proximate four posts near the Sumdurong Chu. The opening Chinese position on that issue was that the Indians should withdraw first (thus making the Chinese posts, reactive in origin, superfluous, and allowing their withdrawal). Beijing's argument was that all the posts were clearly north of McMahon's line, and therefore outside disputed territory, in China proper. But to the Indian side there was no such thing as 'disputed territory', what India claimed to be Indian, was Indian; and therefore there could be no question of the Indian forces initiating the disengagement from the four Sumdurong Chu posts. The Chinese must withdraw first, thus conceding that the territory concerned was Indian. At a working group meeting in New Delhi in August 1995 a compromise was agreed – for mutual, simultaneous withdrawals.[82]

The prompt announcement of that agreement, hailed by the Indian foreign secretary, by now Salman Haider, as a 'historic step', was received by no means as calmly as on previous occasions. Words and good intentions were one thing in Indian political opinion, withdrawal from even a patch of territory quite another. The agreement and the subsequent withdrawal of the two Indian outposts near Sumdurong Chu was strongly criticised by politicians and journalists. Typical, though among the mildest, was the complaint by a former foreign secretary, A P Venkateswaran, who saw in the agreement an instance of India "buckling under and conceding an advantage without ensuring a quid pro quo...."[83] There have been no subsequent significant disengagements from advanced positions, although there have been reports of substantial Indian troop movements away from the China border and towards Pakistan.

In December 1996 a further agreement was signed, again in New Delhi, on "confidence-building measures in the military field" along the LAC. In this the two sides bound themselves not to attack, and to take measures to reduce or limit their military forces in the border areas. Limits were set on the scale and location of military exercises, and provision made for swift communication. Self-restraint was called for in the case of confrontations due to differences on the location of the LAC, and the process of clarification and con-

firmation of that was to be speeded up. The regular meetings to that end continue, but they have been deflected away from the original aim of a progressive strategic disengagement, without prejudice to basic border claims, back towards the nub of the dispute – which territory belongs to which side?

So it is that, as prime minister Vajpayee wrote in justifying his government's nuclear tests to President Clinton, the Sino-Indian border dispute remains unresolved. Indeed it is as far from settlement, and even from negotiation, as ever. The recent public designation of China as India's primary strategic enemy by ministers of the Indian government indicates that the intention of the Narasimha Rao administration to achieve pacification of the borders along the line of actual control does not sit with the approach of the ruling BJP party, and suggests that while it remains in power renewed confrontations may be expected on the border. So reconsideration of the continuing Sino-Indian border dispute confirms, first, that it was not only entirely avoidable but was created through irrational policy-making on the part of the Indian government; second, that the failure to resolve it before the border war and in the decades since is the responsibility of India; third, that it was India's policy which transposed a diplomaticaly deadlocked dispute to the field of war – and, if continued, might do so again.

Seen in historical perspective the border war looks diminished, even trivial. But the conflict had far-reaching and malign consequences not only for India and China but also for the international community. How differently world politics would have developed if Nehru had shown the wisdom and political courage of U Nu of Burma and, like him, had negotiated a mutually satisfactory boundary settlement with Beijing and sealed it, about 1959, with a treaty of friendship and non-aggression. China would then have been spared the odium the conflict and Indian frame-up brought, and instead its international reputation would have been greatly enhanced. Beijing's assumption of China's UN seat would probably have been brought forward by years. India would not have embarked on the intensive re-arming which led Pakistan to venture the 1965 war. Sino-American relations might well have mended sooner, with likely effect on Washington's approach to Vietnam. And of course one excuse for India's nuclear tests would not have existed – but then that is doubly bogus, the Hindu nationalist party had been committed to India's acquiring nuclear weapons since soon after independence.

Real Consumption Levels and Public Distribution System in India

Raghbendra Jha
K V Bhanu Murthy
Hari K Nagarajan
Ashok K Seth

The policy of allocation of foodgrains under the Public Distribution System (PDS) has been very ad hoc in India with allocation being fixed on a 'historical basis'. This paper uses four sets of pooled equations for predicting stable levels of per capita consumption of rice and wheat in physical terms in rural and urban India. Foodgrain demand and the own-price, cross price and income elasticities of demand are estimated for all states. A formula that is based on the concept of subsidising real consumption through PDS is proposed.

I
Introduction

THE policy of allocation under the public distribution system (henceforth PDS) in India has been the subject of intense debate among economists as well as in policy circles. For instance, Parikh (1994) emphasised the implicit subsidy through PDS. So far, the principle of allocation has been somewhat ad hoc. It has been done on some 'historical basis' and is incremented, subject to availability, as per demands from states. The revamped PDS, that has been targeted toward the poor, is based on the notion of providing some quantity of cereals so as to provide at least a part of the minimum calorific requirement (20 kg/head/mensem). This forms the conceptual basis for the PDS. In this sense, the role of PDS is really one of subsidising real consumption. In the present paper we evaluate the current policy of allocation on the basis of this notion of providing a real consumption subsidy.

State Level Cereal Demand: Rural and Urban

The National Sample Survey (henceforth NSS) 45th Round (July 1989-June 1990), 47th Round (July 1991-December 1991) and 48th Round (January 1992-December 1992) contain data on average monthly per capita expenditure (weighted average that accounts for the distribution of expenditure amongst different MPCE classes), quantity and value of rice and wheat consumed per person in 30 days. We first estimated the own price elasticity of demand, the cross elasticity and the income elasticity non-parametrically. However, the data points were very few (three) so that the results were inefficient. Hence, we pooled the data and used appropriate dummies to capture state level differences.

NSS give data for 15 states and three regions that combine smaller states and union territories. Thus, the sample size is 18x3. The implicit price is obtained by dividing the value of expenditure by the quantity of rice or wheat purchased as the case may be. The average monthly per capita expenditure (MPCE) is deflated by the consumer price index (CPI) and taken to be an indicator of real income.

II
The Model

The demand model used is a double-log function so that the estimation of elasticities becomes straightforward.

$$\text{Log } Q^U_X = b_1\text{Log}P_X + b_2\text{Log}P_Y + b_3\text{Log}I + V_1D_C\text{Log}P_X + V_2D_C\text{Log}P_Y + V_3D_C\text{Log}I + wT + \text{state level intercept and trend dummies} + \varepsilon_t \quad ...(1)$$

where

Q^U_X = per capita consumption of X (rice/ wheat) in a month,

A_0 = minimum consumption level,

b_1 = partial own price elasticity,

b_2 = partial cross elasticity (wrt substitute cereal Y),

b_3 = partial income elasticity (wrt (I) money income),

D_C = dummy for major consuming states of the cereal,

V_1 = difference in B_1 for major consuming states (compared to the national average),

V_2 = difference in B_2 for major consuming states (compared to national average),

V_3 = difference in B_3 for major consuming states (compared to national average),

w = growth in minimum consumption level of rice or wheat,

T = time trend, ε_t = error term.

and

$$Q^N_X = (\text{Anti }(\text{Log } Q_X)^*P^R + \text{Anti}(\text{Log } Q_X)^*P^U)^*12 \quad (2)$$

U = (superscript) urban,

V = (superscript) rural,

N = (superscript) national and

P = population.

The predicted value of Log Q can be obtained from (1). Its antilog gives the estimate of per capita per mensem demand for the particular cereal, rice or wheat, which when multiplied by either rural or urban population of India, gives the demand for the particular region. Equation (2) gives the total demand at the national level.

Consumption in each state can be obtained by constructing individual equations from the aggregate equation since the difference in intercept as well as the difference in slope for major consuming states are known. Four equations, pooling all states, were estimated: one each for each cereal and one each for each sector – rural and urban.

III
Stable Levels of Consumption

To return to the theme of state level estimates, it would be appropriate to recapitulate the key issues. At the state level, NSS data reflect the monthly per capita expenditure on cereals, amongst other things. We have used this rich source to estimate the true levels of consumption in different states. The methodology is to estimate demand equations of the type given by (1).

The main interest here lies, however, in estimating the levels of consumption per capita per month on the hypothetical basis that real income remains constant. To this end, the basic relationship between demand, income and prices is used.

In general, the demand function is defined as

$D_x = f(P_x, P_s, P_c, I)$
D_x = demand for commodity x
P_x = price of commodity x
P_s = price of substitutes
P_c = price of complements
I = money income

The demand function is homogeneous of degree zero if the following relation holds:

$$(\partial D_x / \partial P_x)^* P_x + (\partial D_x / \partial P_s)^* P_s + (\partial D_x / \partial P_c)^* P_c + \partial D_x / \partial I^* I = 0$$

Dividing throughout by D_x, this relationship gets converted into an additive function between all the elasticities of demand, namely, the own price elasticity, elasticity with respect to price of substitutes and/or price of complements. This implies:

$$\eta_x + \eta_s + \eta_c + \eta_I = 0$$

where η_i are the respective elasticities. This can be tested using the standard F test. Such a test would reveal whether the assumption of the degree of homogeneity being zero is true. If the test validates this restriction, then the implication is that the levels of consumption remain constant if all prices increase along with an increase in the money income, such that real income remains constant. This is in keeping with Engel's law where the levels and patterns of real consumption depend upon real income. The advantage with verifying such a hypothesis of zero degree homogeneity is that stable levels of consumption can then be predicted. In the subsequent analysis of allocation and lifting from PDS, these stable levels of consumption have been used as a basis for making comparisons. The basic assumption in this study is that in the given three years the average real income is constant. Therefore, stable levels of consumption can be estimated and can be compared with the actual levels of allocation and lifting.

IV
Consumption Level Estimation: Methodology

Regression equations for the four data series relating to demand for superior cereals were estimated by using slope, intercept and trend dummies. One (intercept) dummy each for 18 major consuming states were used to pick up inter-state differences. Similarly, in the initial estimates, 18 trend dummies were also included. Apart from this; a dummy each for major wheat consuming and major rice consuming states was formed. This serves the purpose of identifying the difference between the coefficients at the all-India level and the coefficients for major consuming states of either rice or wheat. For a rigorous testing of the zero degree homogeneity condition, own price, price of substitutes, price of complements and income need to be included as explanatory variables.

Some of the trend variables were found to be insignificant in the initial estimation and were dropped. We also tried to incorporate income inequalities. This was done in the light of the argument of Kumar, Rosegrant and Boulis (1994), who emphasised the significance of income inequalities in the determination of consumer demand. Dummies were created for groups of states amongst the sample 18, which happened to fall in the same quartile range of monthly per capita consumption expenditure. These dummies were used to determine the differences in the coefficients for these four groups in respect of the income variable. Once again, the results were not significantly different from the initial estimates, which took income as a gross variable. Neither were they illuminating in terms of different signs for high as opposed to low income/expenditure classes. The final estimates therefore, were based on the original model in which consumption expenditure was taken in money terms and as a single variable.

Degree of Homogeneity

For verifying the hypothesis of the degree of homogeneity being zero, two tests were conducted. The first was a single linear restriction on all the six coefficients of own price, price of substitutes and income, that is, Test 1. (Major consuming states)

$$b_1 + b_2 + b_3 + b_1^* D_w + b_2^* D_w + b_3^* D_w = 0 \qquad \text{(i)}$$

V
Results

All pooled equations have high explanatory power. The minimum R^2 is 0.98 which is in the case of rural wheat consumption. In all other cases, it exceeds 0.99. Corrections, wherever needed, for serial correlation, were made. (Tables 2.1 to 2.4).

Urban Rice

The own elasticity bears the right sign at the all India level and is large (-1.81 in Table 2.1). For the major rice consuming states, the interaction dummy is significant and positive at 1.48. For them then, the own price elasticity is –.33 (given by –1.81 +1.48). This is expected behaviour. The price of the substitute cereal, wheat, bears the right sign at the all India level and is highly elastic at +1.66. For the country as a whole, income elasticity is –0.40, but for the major consuming states, it is + 0.49 (given by 89 - .40). Most of the intercepts are significant, with the sign varying in different cases. The only states whose intercepts are not significant are Kerala and Tamil Nadu. The noticeable factor is that there is a definite negative trend that is both statistically significant and numerically weighty. This points to a decline in rice consumption in Haryana, Orissa and Rajasthan. at the rate of 19.9 per cent, 16.4 per cent and 14.3 per cent per annum respectively. The reverse trend can be seen in urban rice consumption. However, interestingly, these are independent trends, because the states in which the decline is apparent, do not match the states in which wheat consumption has been rising. A more detailed analysis of the changes in the real income levels and a sub-state level study for regional patterns may reveal a shift towards superior cereal substitutes. Of the two tests, the null hypothesis of zero degree homogeneity is accepted only for the major consuming states (Table 2.1).

Urban Wheat:

Results for this are reported in Table 2.2 Wheat consumption in urban areas has an overall own price elasticity of -0.65. The corresponding elasticity for major consuming areas is less but nevertheless, bears the right sign, and stands at –0.27 (given by –.65 + .38). The difference, however, is significant only at the 10 per cent level. At the national level, the price of rice as a substitute bears a negative sign and is significant, with its value being –0.93. The corresponding elasticity is 0.16 for the major consuming states (given by 1.09 – .93). This means that rice is definitely a substitute for wheat in consuming areas and, significantly, its price elasticity is low. The income elasticity is positive, weighty (stands at around 0.6) and significant at the all India level. On the other hand, it is positive, significant but small for major consuming states at 0.15 (given by 0.59 – 0.44). The states that have an intercept insignificantly different from zero are Gujarat, Madhya Pradesh, Maharashtra, Orissa and Punjab. The upward trend in urban wheat consumption is apparent from the three significant trend variables relating to Tamil Nadu, the north-east and southern states.

This is direct evidence of change in consumption patterns in major rice consuming states. The growth rates are also fairly high. It may be concluded that the total cereal intake in these states has increased since none amongst them figure in the declining trend of rice consumption. The F-test for verifying the restriction regarding degree of homogeneity follows the same pattern of being accepted for the major consuming states and rejected at the all-India level (Table 2.2).

Rural Rice

The own price elasticity at the all-India level is -0.54 and significant. There is no significant difference between the elasticity of major consuming states and the all-India magnitude. Wheat price elasticity is positive and almost equal to unity. It is significant at both levels, but is marginally negative for the major consuming states. The income elasticity of demand, in general, is insignificant but bears a negative sign. This virtually means that rural rice consumption in major consuming states has an income elasticity of demand which is around 0.75, and is highly significant. The intercepts of Bihar, Kerala, Punjab West Bengal and the North-East are not significant. There is an unmistakable trend of decline in rural rice consumption. Significant falling trend rates are observed in Gujarat, Haryana, Kerala,

*Zero Degree of Homogeniety Test: (1) Major Consuming States F(1,29) = .6364540 Significance Level 431482 (2) All India
F(1,30) = 1 065424 Significance Level 3102313

where

LPRW = Log of price of rural wheat,
DPRW = Log of price of rural wheat *dummy for major wheat consuming state
LPRR = Log of price of rural rice (substitute grain),
DPRWR = Log of price of rural rice *dummy for major wheat consuming states,
LMCPR = Log of monthly per capita expenditure (rural)
DMCPRW = Log of monthly per capita expenditure (rural) *dummy for major wheat consuming states,
D1, ..,D18 = State intercept dummies, D1T,...,D18T = State trend Dummies. Not all insignificant dummies are reported.

Madhya Pradesh, Maharashtra, Uttar Pradesh, Rajasthan and the north-west. However, unlike the consumption of urban rice, there is a noticeable substitution towards wheat consumption at least in states like Orissa, Rajasthan and the north-west. The degree of homogeneity is zero at the all-India level (Table 2.3).

Rural Wheat

Rural wheat consumption is negatively related to own price at both levels but is significant only for major consuming states. Its value is –1.06. Rice as a substitute bears a negative sign and is not significant at the all India level but is positive and stands at 0.9 (given by 0.0 +0.9) for the major consuming states. Income in this case is not significant at the 5 per cent level but is significant at the 10 per cent level for both the all India and the major consuming states. The elasticities are respectively 0.17 and 0.42 (given by 0.17 + 0.25) The intercepts are highly significant for all states except Madhya Pradesh and West Bengal. As pointed out, Orissa, Rajasthan and the north west show significant growth rates which are respectively, 0.3, 0.25 and 0.24. It must be kept in mind that these consumption levels are per capita measures. It is significant that, like rural rice, the demand for rural wheat also displays zero degree of homogeneity at both levels. This implies that in general the consumption of cereals in rural areas conforms to real income levels (Table 2.4).

These demand equations were used to predict the stable consumption levels generated on the hypothetical basis that if real income remains constant the levels of demand too remain constant. This is an outcome of the degree of homogeneity being zero, which has been verified at almost all levels, and for both rural and urban areas. The predictive efficiency of the model and the specific equations has been tested on the basis of the ratio of actual levels of consumption to such predicted levels of hypothetical consumption. The results of this test show that the maximum deviation is in the case of rural wheat consumption in Haryana, in 1991, where actual consumption is 42 per cent above hypothetical consumption. This however appears to be an outlier. In most cases, the ratio is very close to unity. On the lower side, the variation does not exceed 20 per cent (for rural wheat in Punjab) in 1990. It must be pointed out that in the other three series, generated by the model, other than rural wheat, the variation is much less. In general, it does not exceed 6 per cent on either side. The deviations

in general do not follow any pattern, neither in favor nor against the major consuming states.

VI
Evaluation of PDS: Allocation and Lifting

Data for allocation and lifting was available for a fairly long period. However, the limitation of demand data restricts the study of such an evaluation to the three years 1990, 1991 and 1992. The earlier exercise, apart from illuminating questions relating to consumption, serves the purpose of providing a basis for evaluating the PDS.

Monthly allocation and lifting data was averaged over the 36 months of these three years. The data was available consistently for 25 states and six union territories. The following indices were developed for purposes of comparison and evaluation.

1 $MPCC_i$ = Monthly per capita consumption (in tonnes) of ith state.
2 $R_mC = MPCC_i / \mu_c$ = Ratio of consumption of ith state to average consumption per capita.
3 $R_aC_i = A_i / MPCC_i$ = Ratio of allocation of ith state to its monthly consumption per capita.
4 $R_lC_i = L_i / MPCC_i$ = Ratio of lifting of the ith state to its monthly consumption per capita.
5 $R_aA = R_aC_i / \mu_a$ = Ratio of R_aC_i to its own average.
6 $R_lA = R_lC_i / \mu_l$ = Ratio of R_lC_i to its own average.
7 $D_iAC = R_aA / R_mC$ = Distortion index of allocation of ith state with respect to monthly consumption pattern.
8 $DiLC = R_lA / RmC$ = Distortion index of lifting of ith state with respect to monthly consumption pattern.

While we admit that PDS has a rationale for subsidising consumption, in its functioning, it should complement the consumption needs and patterns. The above predicted levels of per capita consumption represent stable levels based on tastes and socio-cultural needs. The data on which these estimates were made pertain to total expenditure on food grains, irrespective of whether they are purchased from the open market or PDS. Therefore, both allocation and lifting would form a certain proportion of this level of consumption. Conclusions drawn from implicit subsidies in money terms, in other studies, do not clarify the basic role of PDS in respect of real consumption. The quantity data of allocation and off-take can conveniently be juxtaposed with the quantitative estimates of per capita consumption. A rational policy of allocation needs to be geared to these fundamental consumption patterns. Any amount of

ubsidy in money terms cannot adequately erve the purpose if the outcome of PDS loes not complement these basic consumption patterns. The indices mentioned above seek to delve into the crucial question of whether allocation and lifting from PDS serve this purpose. In this sense, any deviation from the patterns of consumption and demand are distortions and need corrections (Tables 3 and 4).

Urban Rice

The third and fourth indices simply provide an insight into the extent of dependence of the consumer on the PDS. The second index is a measure of the deviation from the average pattern of consumption. For instance, this index varies from a low of 33 per cent to a high of 180 per cent in the case of urban rice demand. The proportion of allocation is extremely low in the case of Bihar (only 2.2 per cent of the consumption level), although its consumption is very near to the average. In terms of lifting the ratio is around 1.1 per cent. On the other hand, Jammu and Kashmir receives 87 per cent in excess of the average consumption, while the lifting is almost equal to its per capita consumption. This deviation is further exacerbated when the percentage of allocation and lifting are seen as a ratio to their own average. In terms of allocation, then, Jammu and Kashmir receives four times the average and the lifting is three times the average. Many other states also display such proportions. The situation of Bihar does not change significantly even if such a measure is adopted. The average per capita consumption is 4.28 kg. The average ratios of allocation and lifting are 40 per cent and 29 per cent respectively. There is a remarkable equivalence if the coefficients of variation of these two ratios are observed. Yet, the CV of per capita consumption is lower. This, in itself, implies that PDS quantities deviate to a greater extent. The equivalence however breaks down when the seventh and eighth indices are observed. Allocation has a coefficient of variation of 1.38 while that of lifting is only 1.22, which is still greater than twice that of per capita consumption (Tables 8.1 and 8.2).

Urban Wheat

The average wheat consumption is 4.25 kg. In spite of excluding Pondicherry, which is an outlier, the average ratio of allocation is 5.86. This is mostly on account of small states and union territories. Here again, Bihar receives only 6.3 per cent and lifts only 5.3 per cent of its per capita consumption. Once again, the coefficients

of variation are similar for both the allocation and lifting ratios and are much higher than the CV of per capita consumption. Bihar gets low levels when its allocation and lifting are considered with respect to the average. Nagaland and Goa recieve almost twice the average, even if Daman and Diu, which are outliers, are ignored. Surprisingly, lifting in Goa even exceeds this high ratio and so is the case with Nagaland. The CV of the distortion index of allocation exceeds that of the index of lifting (Tables 6.1 and 6.2).

Rural Rice

The average per capita consumption is 4.5 kg., while the average allocation and lifting ratios are 31 per cent and 25 per cent respectively. The deviation between the CVs of allocation and lifting as compared to per capita consumption is less than that in the case of urban rice and wheat. The CV of the allocation ratio is less than that of the lifting ratio, but when they are considered with respect to the consumption pattern, the converse is true. Uniformly, Bihar appears at the lowest end. Lakshadweep and Jammu and Kashmir receive more than the per capita consumption and the lifting is much less. With respect to the average, Jammu and Kashmir, Goa, Nagaland Daman and Diu, Delhi and Meghalaya receive a higher allocation. Rajasthan receives allocation equal to the average, but in terms of the distortion indices, the two indices are 41 and 25 respectively. A similar switching of CVs as in the previous case, is noticeable as between the ordinary ratios and the distortion indices of allocation and lifting (Tables 7.1 and 7.2).

Rural Wheat

The average consumption is 3.3 kg. The CV of the allocation ratio is higher than that of lifting and the same pattern is seen as for the distortion indices. In spite of eliminating outliers, the average allocation and lifting ratios are abnormally high This is due to the small states. Bihar continues to trail behind the others with 5.5 and 7.3 per cent allocation and lifting, compared to the average. The CV of allocation and lifting is more than two times that of the per capita consumption (Tables 5.1 and 5.2).

VII
Policy Implications

The following varieties of mismatches are illustrative of the irrationalities in the PDS system.

(1) Allocation in many cases is in excess of the absolute level of per capita real consumption per month (PCC).

TABLE 7.1: RURAL RICE DEMAND AND PDS – ALLOCATION/LIFTING

(2) Allocation as a ratio of the PCC, in certain states goes down to 2 2 per cent

(3) Similar incongruencies exist in respect of lifting

(4) The gap between allocation and lifting is glaring in many cases This also points out towards misallocation

(5) There are differences between the allocation to consumption ratio as between urban and rural areas

There is no doubt that the quantitative interventions in the real consumption and demand patterns caused due to allocation and lifting are significant To say the least a thorough look into the pattern of allocation is a must Even though there may be instances where lifting appears to be a greater source of distortion it should be remembered that lifting is circumscribed by allocation A correction in the policy of allocation is imperative and lifting would follow suit A study towards this end would be worthwhile and is capable of yielding concrete criteria for overhauling the allocation pattern so as to make PDS rational and viable complement of market demand while retaining the variations in tastes and socio cultural patterns in consumption

The following formula can form the basis for allocation

F_s^t = Food Surplus (less emergency stock wastage and open sale stock)

$F_t^d = \Sigma_N$

$F_d^t = \sum_i^N F_d^s$ = Total food demand over N states

F_d^s = Pop(s) * PCC (s)= Food demand in s th state Pop(s) = Population of s th state

PCC (s) = Per capita real consumption of s th state in physical units

F_s^t / F_d^t = ARAR = Adjustable Rationing Allocation Ratio

Allocation to each state = ARAR* F_d^s

The ARAR can be adjusted according to the food surplus every cropping season The sub-allocation can be done at the state level on a *pro rata* basis

VIII
Conclusions

In this paper we have examined the rationale for the current allocation pattern of rice and wheat through the PDS in India and found it to be wanting in at least one important respect – the allocation pattern appears to ignore the structure of consumption demand in the country An alternative formulation is therefore suggested in the paper

Interpreting Amartya Sen's Work

Ashima Goyal

THE *EPW* (November 7 and December 5 and 12, 1998) has carried a lively series of articles interpreting the huge corpus of Sen's work. An economist writing about another reveals more about his own priorities, but taken together all the perspectives flesh out a fuller picture. Even so, the clear logical progression evident in the work has not been remarked upon. In spite of its large size, it is almost as if Sen had followed a plan laid down in the beginning. But more probably, outcomes were the logical consequence of initial choices.

For Abhijit Banerjee Sen's major contribution is in applying rigorous micro-economic tools to the analysis of development and therefore bringing development into the fold, as it were, and opening the way for others to follow. But after his initial work on choice of techniques and growth, Sen began to explore the relationship between social welfare and individual preferences. He concluded that the way through a thicket of impossibility theorems that led to inconsistencies in aggregation was to abandon standard micro-economic maximisation. Therefore after pointing a particular direction to others, he himself withdrew from it. He wrote extensively on the necessity of using non-utility information, on changing preferences by the development of human capabilities. In the period of his intense involvement with social welfare and philosophy, he had continued to write on development – major spin-offs were on the analysis of inequality and development indices. But with the concept of capability the circle was complete and led him back full-time to development: education, gender, nutrition and public action as means of enhancing human capabilities.

Has Sen indeed betrayed Abhijit Banerjee? Modern economic theory is firmly based on individual decisions, and his careful foray into the dilemmas that arise in trying to derive social welfare from the individual has left Sen firmly on the side of the individual. In that sense he is still very much in the modern economic tradition. In returning to the theme after the debate that followed his paper on the 'Impossibility of the Paretan Liberal', he concludes that the way to resolve the impossibility is to weaken the requirement of the Pareto principle rather than disregard individual preferences. He had discovered that a liberal who wanted both to guarantee freedom of choice in personal matters and ensure that if every individual preferred an alternative society should prefer that one would be led into contradictions. Most commentators had felt that since the unanimity of preferences was such a basic requirement for social welfare, a way must be found to salvage the Pareto axiom. But Sen wants to go beyond preferences to developing individual capabilities; and in this way he both deeply respects the individual and betrays Abhijit Banerjee, because modern micro-economics takes preferences and technology as a datum that must be respected.

Sen made a revealing remark in his speech at the UN in memory of Mahbub ul Haq. Recollecting their days as students and the seeming irrelevance of the analysis they learnt to the burning issues of poverty that concerned them, he remembers telling Haq that we have to master the pricing of toothpaste, otherwise no one will listen to us. Sen has indeed mastered the art of "precisely conveying the imprecise science of economics", and pushing his own very different agenda in a language modern and logical enough to command respect. Only when the emotional heart of the reformer combines with a hard analytical brain is it possible to build a bridge between the east and west. It will not be irreverent to draw an analogy with the success of Shekar Kapoor. The emotional heart of Indian films combined with the skills and packaging of the west has made an unbeatable combination. This is not the same as saying that the east is emotional and the west rational; the east has an ancient very rigorous intellectual tradition that can easily don the mantle of modern sicentific language or standards. But the universality or staying power comes fr[illegible] the human concerns.

Kaushik Basu (*EPW*, December 12, 1998) makes the point that Sen's position is often ambiguous, precisely to make it possible for readers to find whatever they were looking for. But such a position need not please all – it can also displease all. One can fall between two stools. Although a good communicator is always sensitive to the concerns of his audience, in a fundamental way a middle of the road position is a very Indian and a very intellectual way of analysing the world. It can come closest to the truth because it can recognise shades of grey. Nehru was attacked for sitting on the fence, and called an intellectual because he could see two sides of a coin. India's policy of non-alignment displeased many. Indians have always been good at forging their own creative synthesis, and it is works if it anticipates trends of the time. Both the left and right have claimed Sen – but he says that he had read the writings of both and agrees with neither. To find a new path between fashionable extremes is a risky strategy, but the deep respect for intellectual traditions and for the individual are what have given it resonance and made it so successful. Concern for the flowering of individual capabilities is a persistent theme in Indian philosophy.

Bagchi (*EPW*, December 5, 1998) remarks that in his career Sen has often returned to themes he has touched upon at one stage. The one topic with which he has not done so is his early work on growth. There is a complete returning to early roots in the overall pattern of his work, but one strand remains for completion. There is time for Sen to work out the links between the development of human capabilities and growth. The whole of India cannot afford to be a Kerala.

Gender Inequities: Focus on Tamil Nadu

Policies to increase women's wage employment often take the easy way out by facilitating the setting up of industries that are seen to be compatible with women's household responsibilities rather than address the constraints that force women to engage in so-called women's work. The interplay of patriarchal structures and capitalist relations of production in Ambattur in Chennai, one of Tamil Nadu's oldest industrial belts. **WS-2** The construction of home-workers as housewives and home-work as a practice that allows a woman to care for children and perform her household tasks while earning much-needed income conceals the reality that women not only put in long hours of work to fulfil production targets set by employers, but have little idea how their wage levels are arrived at. The beedi industry in Tirunelveli district. **WS-12** Employment generation does not necessarily translate into a better deal for women. Leather tanning industry in Dindigul. **WS-21** Wife-battering is shrouded in patriarchal myths and stereotypes which need to be cut through to understand domestic violence. Rising curve of violence against women in Chennai city. **WS-28** The rapid fertility decline in Tamil Nadu in the 1980s is often attributed to female autonomy and 'agency'. Fiscal Deficits: Expected and Actual

Fiscal deficits that are expected to be reversed at some unknown date in the future cause a real appreciation of the exchange rate along with an expectation of depreciation, a trade deficit and high domestic interest rates. The expectation of depreciation will have a positive impact on investment provided a time-frame within which the deficit can credibly be reduced is charted and acted on. **963**

Patent Lies and Latent Danger

What should India's position be on the TRIPs review in 1999? It is possible to take a mini-max approach, striving to undo as much of the damage as possible, while keeping an eye on the minimum that can be achieved even within the WTO framework should a drastic revision of the Marakesh agreement become politically feasible. **979**

New Patterns of Urban Growth

Examination of the size and type of investment in the larger cities indicates that there are emerging urban cores of high investment even as other cities and the regions surrounding them are being virtually bypassed. **969**

Beyond Lahore

As the US and USSR did decades ago, India and Pakistan have started to turn to 'transparency' measures as a way to reassure themselves, and the international community, about the nuclear dangers they have created. **938**

Attacks on Tribals

Through the Narmada dam agitation the tribals have rediscovered their identity and found a new strength. The attacks on Christians in Gujarat which have targeted the tribals are the response of the business class to this challenge from the downtrodden. **949**

Dissent on 'Fire'

Most of the defenders of the film 'Fire' have followed the lead of the protesters and pitted their own version of Hindu culture against that of their adversaries. Hardly any considered the issue as a human condition. **955**

Enterprise and Tradition

Two contradictory forces – a spirit of enterprise and a tradition-bound status-consciousness – led the Patels of central Gujarat first to Africa and then to the UK where they are today successful businessmen and professionals. **953**

Double Standards

One of the measures that the US justice department is contemplating, in its anti-trust case against Microsoft, is compulsorily licensing Microsoft products to others to break its monopoly. This is in sharp contrast to the strenuous US opposition to compulsory licensing under the WTO framework. **946**

Urdu and Its Future in India

I HAVE just read Syed Shahabuddin's response (March 6-13, 1999) to my article on Urdu in India since Independence (January 2-9, 1999). I was gratified that he responded so fully but there are things in his letter about which I need to give clarification. There are points on which we are clearly in disagreement and I shall return to these below, but there are others on which he is mistaken in thinking that he and I disagree and yet others on which it is not clear whether we disagree or not.

The most important point of the first kind is that about 'immigrant communities'. I never said that the Urdu-speaking community is an immigrant community. Of course it isn't, and it would never have entered my head to suggest that it was. I merely drew a parallel between the problems of language maintenance faced both by immigrant communities in Britain and the Urdu community in India. I drew attention to the measures which the former have taken to meet this problem and said that the Urdu community should take similar measures but has not done so. I do not for a moment accept Shahabuddin's assertion that the Urdu community is too poor to undertake this. The problem is not money but the absence of the will to act. I nowhere suggest that the Urdu community sets up a parallel system of schooling to replace the state system and the teaching that goes on in the madrassas. With regard to the state system, the Urdu-speaking community should not only continue to take advantage of such provision as already exists, but press for a great deal more. Nor do I suggest that Urdu should be "expelled from the madrassa milieu"; all that my article suggested was that Urdu speakers should not demand more of the madrassas than they are ever likely to be willing to give. It is not clear whether Shahabuddin thinks that I am advocating the abandonment of the Urdu script and the adoption of the Devanagari script instead. I was simply saying that Urdu speakers should welcome and actively support those who are presenting Urdu literature in Devanagari. Every community is entitled to write its language in the script of its choice, and this is the fundamental fact that should be recognised by all who are interested in this question of scripts. It would be perfectly easy to prove on purely linguistic grounds that the Roman-based script proposed many years ago by J B Firth is more suited to the accurate representation of Urdu sounds than any other. But I have never advocated, and never will advocate, that the Urdu-speaking community should adopt this script. The Progressive Writers' Association very quickly realised that the proposal for the adoption of the Roman script, which it had made in its first manifesto, must be dropped. It is quite pointless to suggest the adoption of the Roman script to a community when you know perfectly well that 99 per cent of the members of that community will reject it. So my stand is that Urdu speakers should continue to use their traditional script but they should also welcome the initiatives of others who wish to use the Devanagari and the Roman scripts to enable readers who do not know the Urdu script to gain access to Urdu literature.

There are a couple of minor mistakes which you made in publishing my article. You say that I am a lecturer in Urdu at the School of Oriental and African Studies. In fact I was made a Reader in 1964 and retired from SOAS in 1981. Later on you speak of my correspondence "with the Chancellor of Jamia Millia". You should have said "the former Chancellor".

RALPH RUSSELL

London

Documenting People's Projects

FOR decades we have lived in a state, where the government maintained a paternalistic attitude and took responsibility for everything from providing basic needs like water, roads, health services, education, public parks, protection and rejuvenation of natural resources, etc, in exchange for the taxes it collected. At the same time, it looked at all kinds of private and community initiatives in these areas with scant respect or even suspicion. Over the past couple of years there has been a gradual shift in its thinking. It has almost accepted that it is ill-equipped and inadequate to the task that it had assumed for itself. So, while the government will continue to collect more and more taxes, it has mercifully accepted the fact that people themselves have a right to create and maintain community assets and tak measures that would make their lives les difficult and little more pleasant.

Fortunately, despite its sincere efforts the state has been unable to kill communit initiative across the country, specially i rural and tribal areas. There are hundred of instances where people, residents asso ciations, gram panchayats, youth clubs mahila mandals (women's organisations) community organisations, traders' asso ciations (the civil society in short) go together to raise resources, use locall available skills and contributed voluntar labour to achieve the desired goals be i in the area of protection of environment creation or rejuvenation of water bodies protection of historical sites, setting up o educational institutions, provision fo health services, construction of link road and bridges, creation and maintenance o public parks, etc. At the same time, thes very people's organisations raised thei voices in protest, when they found th policies, projects or decisions of th government anti-people or contrary to th local ethos. Many such ideas and exampl can not only inspire but would be wortl emulating and replicating.

We are in the process of researching an documenting such instances to stimulat and induce similar activities in other area and would welcome the help and suppor of readers of your publication. We ar particularly interested in independen initiatives that have been launched an sustained without any financial suppor either from the government or other dono agencies. Since the very idea behind thi exercise is to promote voluntary action while it may not be possible to compensat contributors financially, their contribution will be appropriately and gratefull acknowledged.

Structural Reform of Money Market

THE Reserve Bank of India's monetary policy statement for the current fiscal year is a down-to-earth, no-nonsense document. Except for the 0.5 per cent cut (from 10.5 to 10 per cent) in the cash reserve ratio (CRR), which a purist may find hard to accept, especially at a time when the rate of growth of money supply (M_3) has consistently been well above the rate of growth of the real economy, there is little attempt to play to the gallery. The document makes a frank admission of the dilemmas of a central bank in trying to reconcile multiple and often conflicting goals. And then gets down to the nitty-gritty of much-needed structural reform in the money market, which is critical to improving the efficacy of the central bank's signalling mechanism.

The policy stance continues to be easy, driven by the desire to ensure adequate liquidity along with stable medium- and long-term interest rates, with a "preference for softening to the extent circumstances permit". In an uncertain macro-economic scenario, there is always the danger that adjustments in liquidity, either to dampen demand or to spur growth, could overshoot. At the same time, given the lagged impact of any change in money supply, corrective action may often prove to be a case of too little, too late. Consequently, monetary authorities must constantly be on guard – ready to reverse their policy stance in case the actual outcome is very different from that anticipated. The policy makes it quite clear, therefore, that while the RBI is going along with its easy money policy for the moment, it will not hesitate to alter its stance, should the situation so warrant.

Beyond that, the macro-economic projections made by the RBI are more or less in tandem with those made by the finance minister at the time of the budget. GDP growth for 1999-2000 has been pegged at 6-7 per cent, inflation at 5 per cent and M_3 growth 0.5 per cent higher, at 15.5-16 per cent as against last fiscal year's target range of 15-15.5 per cent. This target has, of course, not been of much more than academic interest, since actual M_3 growth has been well above the target in the past three years. No doubt, the fact that despite this higher-than-projected rate of growth of M_3, the annual rate of inflation has been within bounds has lent courage to the RBI to continue with its easy money stance for the present.

Ideally, as the policy points out, M_3 growth should have been pegged in the range of 15-15.5 per cent, as in the past. But this may jeopardise the government's ambitious borrowing programme for the year. With gross borrowing in 1999-2000 pegged at Rs 84,000 crore, according to the budget estimates, a more restrictive policy could lead to private investment being crowded out by government borrowing. Clearly, the experience of the last fiscal year when government borrowing overshot the target by almost Rs 15,000 crore (gross borrowing was Rs 94,000 crore as against a target of Rs 79,300 crore) has played no small part in shaping the bank's final stance. But with every rupee of fresh government borrowing now bringing just 67 paise into the government's coffers, down from 89 paise in 1991-92, the position is clearly not sustainable over the long run. Ultimately, as the policy warns (not for the first time) a stable interest rate regime can only be ensured if government borrowing is kept "within reasonable limits".

A considerable part of the policy statement is devoted to structural reform of the money market. The aim, as the RBI has set it out, is to improve the mechanism for transmission of signals from the central bank to the rest of the system. The underlying rationale is simple. While liberalisation has made it impossible for the RBI to directly influence either credit or interest rates, it has not proceeded far enough to allow the RBI's monetary signals to be transmitted effectively to the rest of the system. The result is that the central bank's signals are often like water off a duck's back. Witness the way the bulk of the banking sector, barring the public sector banks, shrugged off the RBI's post-budget package.

In the pre-reform period, things were different. The RBI was firmly in the driver's seat. It could, and did, dictate interest rates. But today interest rates have been all but completely deregulated. The only way the RBI can influence rates is by giving signals – signals that the market should, ideally speaking, then pick up and transmit. In other words, the RBI, like other central banks, now has to influence monetary conditions by influencing the level of liquidity in the system through indirect, market-based instruments like open-market operations and repo/discount windows.

However, the success of these market-based instruments depends on the existence of vibrant, liquid and efficient money markets, well-integrated with other segments of the market. Unfortunately, our markets are narrow and fragmented. The RBI on its part is willing to absorb liquidity through its repo window but is not so willing to

inject liquidity through reverse repos. This is because, despite the shift from the earlier system of automatic monetisation through ad hoc Treasury Bills (ad hocs) to ways and means advances, the bank has very little control over a key component of reserve money - net RBI credit to government. Consequently, it is always apprehensive of injecting liquidity into the system. To that extent, its ability to influence interest rates is limited - it can push rates up but cannot push them down as easily.

It is this vacuum that the RBI's latest policy seeks to fill, both by widening and deepening the repo market and by introducing an interim liquidity adjustment facility (ILAF). Repos facilitate riskless deployment and raising of short-term liquidity. An efficient repo market is, therefore, critical to the development of a vibrant money market. Repos have now been permitted in PSU bonds and in other bonds of corporates and all-India financial institutions held in demat form in depositories and transactions done in authorised stock exchanges.

Further, the number of participants has been increased by allowing non-bank entities which are currently permitted to undertake reverse-repos to also borrow through repos. Here the RBI seems to have suddenly got cold feet - the relaxation is only for such non-bank entities as are already permitted to lend through reverse repos, not for new entities that may wish to do so. Nonetheless, it is a good beginning and should go a long way to improve the efficacy of the transmission mechanism so that monetary signals are promptly picked up and transmitted throughout the system. That itself will be more than half the battle won.

POLITICS

Sham Contest

A correspondent writes:

TO fill the vacuum of their valueless politics, national leaders are offering communalism as the most important issue today. But whichever party forms the next government, it will have no effect on the problem of communalism. For the communal problem is not about the power the BJP holds but about the reasons why people vote for the BJP. This is why even another election will not take us any nearer a solution to the problem.

The parties that present themselves as secular are not necessarily seen as secular by the voters. At election time, communalism is rarely the deciding factor because it would only be a case of choosing the lesser evil. Other issues then decide the voter's choice. This means that the representatives of the people make the issue of secularism the deciding factor without the voter's say-so.

Why do some people vote for the BJP? Of all BJP voters, there must be some that believe in the hindutva ideology. Some others may not be in favour of hindutva but may also consider it not important enough a factor to be the sole basis of rejecting the BJP. There must also be some that pay no attention to any issue but vote for the candidate with the biggest banners and the loudest speakers. BJP's rathyatras would certainly impress such voters. Those who believe in secularism as a value will certainly not vote for the BJP, but then some of them may not vote at all so that their vote does not count against the BJP. They may not find the other parties good enough to vote for solely in order to oppose the BJP.

Religion is important to a large majority of Indians in their private lives. The relation between the state and religion has not been clearly defined. Secularism is a separation between the private and the public. In this sense, secularism is a negative value: it is the absence of government interference in affairs that are best left in the private domain. But political and social leaders have equated secularism and good communal relations making the latter something that the government would provide for the greater good of the people. This is a contradiction in terms. A secular state cannot provide good communal relations.

The idea of the government staying out of anything it could possibly meddle in is anathema to some. Voters have been encouraged to believe that the government is a limitless bank account from which the largest, most vocal group can draw the most, no matter at whose cost. The numbers game inherent in a democracy has made the welfare state an auction house where the largest group can bid the highest. Unless the government interferes in every conceivable activity, there will be less to bid for and less to appropriate. Having learnt this lesson well, the voter will not attach great value to secularism defined as governmental non-interference in religious matters. The same holds for economic reforms. Many Indians do not like the recent economic policy changes. Those who accept them do so for the obvious practical benefits of these reforms. No such practical value attaches to secularism.

Politicians and social thinkers have promoted secularism as 'love thy neighbour' for a long time. Can we now go back to the dictionary definition of secularism as governmental non-interference in religious matters? It goes without saying that physical violence is always in the public domain and must be dealt with by the government. But can we leave the choice of loving one's neighbour to the citizen? This will not immediately solve the problem of communal hatred. But this narrower definition will leave a smaller gray area to force some of the undecided voters to make up their minds. This will separate the hardcore hindutva believers from the secular citizenry. That will be no small gain.

PHARMACEUTICALS

Ignoring Institutions

IT is of course commendable that the National Human Rights Commission (NHRC) has been investigating a complaint by the Himachal Pradesh State Human Rights Commission about the supply of fungally contaminated large-size intravenous fluid packs to the Indus Hospital in Shimla. It is even more satisfactory that the commission set up an expert panel to go into the matter which undertook its job seriously and submitted its report within the allotted time. On the basis of this report the NHRC has last month recommended that the central government revamp the entire system of licensing new product approvals, certification and quality control checks, etc. No doubt the authority of the NHRC is such that its directive will be taken seriously. The point, however, is why, given the numerous authorities involved with drug licensing and quality control, it was thought necessary to move the NHRC.

Over the decades the drug controller's office has come under severe criticism, a case in point being the J J Hospital tragedy in Mumbai, involving contaminated parenterals which was so ably and thoroughly investigated by Justice Lentin. While wide-ranging recommendations were made, few, including those of an urgent nature such as the transfer/removal of the officials involved, were accepted or carried out. The commission has also pointed to the inadequacy of personnel and laboratory facilities. It had made specific recommendations regarding the indenting and purchase of such material in public hospitals and the manner in which they were distributed and the records maintained. Given this it is rather surprising that the NHRC has not sought to draw attention to the report and ask why its recommendations have been ignored.

Moreover, at various points the drug consumer movement has raised questions about the functioning of the drug control authority in regard to the licensing of

drugs. For instance, the ease with which drugs are licensed has been called into question, also, the fact that the licensing authority appears to be lax on on-site requirements at the manufacturers' end, particularly for small firms, has been pointed out often enough. If little has been done on this count, it is because the drug control is really nobody's business. Within the chemicals sector, under which falls pharmaceuticals, quality control is the business of the individual industry. Apart from the banning of hazardous chemicals, the ministry has no special machinery to inspect the industry other than what applies to all industries as a whole. The drug control authority is a special case – in that it exists because the products, pharmaceuticals, affect the health of people. Thus the health ministry has jurisdiction over the authority which deals with products which come under the chemicals ministry. This dual authority structure allows for a great deal of laxity and the shifting of responsibility. Thus the drug authority has never had adequate funds for carrying out the tasks it is supposed to. This fact plus the extraordinary degree of corruption, as brought out by the Lentin investigations, make for one of the most loosely controlled drug control regimes among countries which manufacture such a range of pharmaceuticals as India does.

There is also something a little disturbing about the fact that the NHRC should have been approached on this count. Most certainly, it is a human rights issue, but then this is one sector where there exists numerous authorities set up precisely to process such matters. Overlooking and ignoring such institutions in the very first instance only allows the state to sideline them – as in fact has been happening. The newly constituted National Pharmaceutical Pricing Authority, which came under heavy criticism from the industry lobby when it was set up two years ago, is now facing a challenge with the state issuing guidelines that the price-fixing undertaken by the authority will be subject to the approval of the ministry. This trend should be resisted, if democratically constituted institutions, which after all have come about as a result of popular demand, are to survive. It is imperative that the tasks of control and monitoring are given a base independent of the political authority, with adequate safeguards. By not moving existing institutions and not seeking out the trajectories of earlier recommendations, however inadequate they may be, people's movements are allowing for a reversal of the hard won gains of the drug and health movements. It is after all in their usage that democratic institutions come into their own and become stronger.

BIHAR

Populist Slogans and Manipulative Politics

THE political shenanigans in Delhi have effectively overshadowed the less eye-catching rogueries that are taking place in another part of the country, Bihar, which attracts national attention only when massacres happen there. But under the rule of Rabri Devi, there are other less obtrusive developments taking place there which are dragging down the state into a sickening political, economic and social morass.

Apart from the Rs 950 crore fodder scam, in which the chief minister's husband Laloo Yadav (who is the effective ruler of Bihar) has been already charge-sheeted, he is facing yet another probe in connection with the bitumen scam. A senior minister of the Bihar government is reported to have told the CBI that Laloo Yadav had been the main beneficiary of that scam. But while one after another, these allegations against him keep on accumulating, Laloo Yadav continues to rule the roost in Bihar by virtue of his manipulative powers. The latest instance is his success in swinging a Rs 500 crore package for rural development from the centre and he is doing his best to publicise it to boost his image as the saviour of the state's poor. He can get away with anything because very few among the poor who are supposed to be the would-be beneficiaries of this package would ask him about the fate of similar central funds that he had received in the past. They do not know that while Laloo Yadav was bragging about his achievement in getting all that money from the centre for rural development, his government was at the same time surrendering to the centre Rs 450 crore of central funds that it had received last year for the same purpose of rural development. His government was returning the money since it did not spend it on the programmes for the rural poor as it had promised to do. The administration under Laloo Yadav has been notorious for the non-utilisation of central funds. The noises that Laloo Yadav is making now about utilising the latest central allocation of Rs 500 crore for Bihar's rural poor are quite likely to evaporate into thin air as have so many promises of his in the past. Yet the people of Bihar seem to have an endless appetite for promises handed out by Laloo Yadav, and an equally undying faith in their fulfilment in some distant future.

Another typical instance of how Laloo Yadav can make his false promises sound true is his latest visit to Jehanabad, in the wake of the recent massacre of dalit labourers, where to the applause of his supporters gathered there, he announced the distribution of 393 acres among the landless. Yet, according to the district administration, in Jehanabad Laloo Yadav was already supposed to have distributed 451 acres (out of the 605 acres vested with the government as surplus land) in 1991, which left the government with only 154 acres. Where is the rest of the land to come from? But since no one asks him the question, Laloo Yadav can get away with any populist gimmick.

Both the Bihar chief minister and her husband (for whom she rules as a proxy) have had the privilege of treating Bihar as their fiefdom for more than a decade now. They seem to be lucky enough to continue in that role. Soon after having got a reprieve following the centre's failure to ratify president's rule, Rabri Devi has had another stroke of good luck when the Supreme Court recently extended by another three months the bail to her husband Laloo Yadav in the fodder scam case. Laloo Yadav will thus be free to continue to rule Bihar by the same old cunning mixture of populist slogans to woo the rural poor dalits on the one hand and manipulative measures to maintain the loyalty of his own OBC middle class farmers and win the support of the bhumihar and rajput landlords on the other. It is the maintenance of this precarious balance of socio-economic forces in Bihar which is necessary for Laloo Yadav to survive and continue to rule.

BoP data for nine months April-December 1999 show a trade deficit of $11.30 billion. With net invisible receipts of $7.3 billion, the current account deficit stood at $4.2 billion. Imports of gold and silver also aggregated $4.2 billion during the period. The year has ended with a reserve build-up of $3.56 billion. But for RIBs worth $4.2 billion reserves would have fallen by $650 million. The latest DGCI and S data for April-February place the trade deficit at $8.1 billion against $6.8 billion for the whole of 1997-98.

DABUR INDIA

Rising Sales

DABUR INDIA is one of the country's oldest health and personal care companies. The company markets ayurvedic and herbal products. Established in 1884, Dabur is a household name for such well known products as Hajmola, Chyawanprash, Dabur Amla and Lal Dant Manjan. The company today boasts of nine brands that command 65 per cent or more of the market share in their respective product categories, a strong product base, a distribution network and retail reach that could give any health and personal care company a run for its money.

The year 1997-98 saw the company increase its net sales by 14.9 per cent over the previous year. However, a steep increase in operating expenses diluted the rate of growth in profitability. Consequently, operating profit rose by a lower 5.2 per cent over the same period. Though interest expenses fell by 11.1 per cent, a sharp increase in depreciation (up 43 per cent) more than offset the advantage. The company's bottomline increased by 4.8 per cent during the year under review.

With earnings per share rising from Rs 14.9 to Rs 15.6, the company decided to raise the dividend rate from 30 per cent last year to 35 per cent. Book value, meanwhile, edged up from Rs 68.3 per share to Rs 79.7 per share. The company's stock presently quotes at around Rs 603 on the bourses, discounting its 1997-98 earnings by 38.7 times, reflecting the high investor fancy it enjoys.

During the year, the company's new, highly automated manufacturing unit to produce brands such as Chyawanprash, Janma Ghunti, Ayurvedic oils and Asav-Arishtas, came into operation at Baddi (Himachal Pradesh). The company claims that this, apart from underwriting the quality of the products, substantially reduced per unit energy consumption and improved yields. In order to complete the expansion plans at Baddi for its branded products, a new modern unit has also been constructed to produce a range of softgel products. The company's bulk pharmaceutical compounds manufacturing facilities at Kalyani (West Bengal) also became fully operational during the year under review for producing oncology and non-oncology products for both the national and international markets.

Meanwhile, for the first nine months of 1998-99, the company notched up a 9 per cent increase in net profit over the corresponding period last year. Net sales during the same period rose by 17 per cent and operating profit improved by 11 per cent. Encouraged by its performance, the company declared an interim dividend of 20 per cent for 1998-99.

Dabur India has set up a 50:50 joint venture with Bongrain International SAS of France for the manufacture and marketing of world class processed cheese. The joint venture company, christened Dabon International, has set up manufacturing facilities near Delhi at a cost of Rs 20 crore. Dabon has already launched French processed cheese LeBon which is 100 per cent vegetarian.

While setting up one joint venture, Dabur India has sold its entire stake in another joint venture – its 49 per cent joint venture with Spanish confectionery major, Agrolimen group. The joint venture company, General De Confiteria India is being handed over to the Agrolimen group for a consideration of Rs 35.25 crore.

JAGATJIT INDUSTRIES

Sell-Off Rumours

Jagatjit Industries, which is engaged in the manufacture of liquor, is the owner of such well-entrenched brands as Aristocrat, Aristocrat Premium, Binnies and Bonny Scot. Its milkfood division is also engaged in manufacturing such well known brands as Maltova and Viva. The company has some 250 distributors in the country with a strong presence in the north. It has the largest, state-of-the-art distillery at Hamira in Punjab with a capacity of 48.5 million litres per annum. The company has been in the news repeatedly because of rumours of it being taken over by multinationals – first it was Hiram Walker (now Allied Domecq), then came the much talked-about deal with Bacardi, and later the alleged sell-off deal with Brown Forman Corporation, a Fortune 500 company. However, the company's chairman and managing director, Ladli Pershad Jaiswal, has denied all such rumours.

For the year 1997-98, Jagatjit Industries witnessed a mixed performance. While net sales rose by 18.6 per cent over 1997-98, operating profit fell by 1.5 per cent over the same period. Despite steep increases in interest (up 16.8 per cent) and depreciation (higher by 54.9 per cent), the company managed to post a 5.9 per cent increase in its bottomline, aided largely by an increase in non-operating profit (up 191 per cent) and a fall in taxation (down 34.1 per cent).

Despite its poor performance on the operating profit front, Jagatjit Industries was till recently one of the most profitable companies in the liquor industry. In fact, while leaders like Shaw Wallace and United Breweries, with market shares of 17 per cent and 29 per cent, respectively, posted negative profit margins in 1996-97, Jagatjit Industries, which has a 6 per cent market share, notched up a relatively high profit margin during the same year.

Jagatjit greatest advantage is that it has a core consumer segment committed to some of its brands, in particular, Aristocrat. In fact, the repeated rumours of being taken over by multinational is understandable since the company would give an MNC a head start of 7-8 years over its competitors straight away, especially considering Jagatjit's marketing network. Further, the company's distillery at Hamira is one of the finest in the country. Further, while all other distilleries are restricted in the raw materials that they can use to manufacture alcohol, the company's unit is the only one allowed to make spirit from molasses and grain.

The company's share price currently rules at around Rs 85 on the bourses, discounting its 1997-98 earnings by 18.9 times.

DCL POLYESTERS

Excess Capacity

Hyderabad-based DCL Polyesters is engaged in the manufacture of polyester filament yarn (PFY), polyester chips and draw texturised/twisted yarn. The company's performance during the year 1997-98 was far from satisfactory. However, there was a marginal improvement over the previous year. Though net sales remained virtually stagnant as compared to 1996-97, operating profit increased by 8.7 per cent over the same period. Interest charges declined by 2.1 per cent and depreciation increased by 2.9 per cent. As compared to a net loss of Rs 12.9 crore in 1996-97, the company posted a lower net loss of Rs 9.9 crore in 1997-98.

Production of PFY increased from 29,024 tonnes during the previous year to 31,117 tonnes, representing an increase of 7 per cent. The company also manu-

NA: means not available.

factured 4,625 tonnes of draw texturised/twisted yarn as compared to 2,383 tonnes produced in the previous year, which is an increase of 94 per cent. However, production of polyester chips fell from 18,687 tonnes to 17,276 tonnes (including quantity utilised for PFY production). Sale of PFY too increased by 9 per cent in volume terms from 28,519 tonnes to 31,175 tonnes, while that of draw texturised/twisted yarn was higher by 97 per cent at 4,612 tonnes.

The company's main raw material are purified terephthalic acid (PTA), mono ethylene glycol (MEG), polyester chips and partially oriented yarn – 25 per cent of which are imported. The extent of import content in raw material has come down from 30 per cent in 1996-97. Consequently imports during the year fell by 43 per cent. Exports, on the other hand, improved by 41.8 per cent with the company exports goods worth Rs 13.3 crore as compared to exports of Rs 9.4 crore made in the previous year.

Despite the company's somewhat improved performance, the recessionary conditions and imbalances in demand and supply in the polyester industry continued unabated during the year under review. The additional capacity created during the last couple of years has resulted in an oversupply situation and this was further compounded by the threat of cheaper imports from south-east Asian countries. The crashing prices put tremendous pressure on margins and realisations were far from remunerative. DCL Polyesters claims that the slight improvement in its performance (if it can be called that) was due to the fact that it employed the latest continuous polycondensation technology to manufacture PFY at a lower cost and with minimum wastage. Further, an assured supply of PTA and MEG, the two major raw material for PFY, and a strong marketing and distribution network were added advantages.

During the year, the company undertook modification and expansion schemes for optimising its operations. The modification scheme envisaged converting three of the six extruder lines to direct spinning lines at a cost of Rs 3.87 crore, resulting in saving in operational costs. The expansion scheme was to enhance the texturising capacity from 5,000 tpa to 7,500 tpa by adding three more texturing machines at an estimated cost of Rs 10.6 crore. This was being done to take advantage of the increased margins for texturised yarn.

The company's share price has taken a beating in the stock market with its stock quoting below par at a mere Rs 3.5, reflecting the low investor fancy for the scrip

Beyond Lahore: From Transparency to Arms Control

Zia Mian
M V Ramana

As the US and USSR did decades ago, India and Pakistan have started to turn to 'transparency' measures as a way to reassure themselves, and the international community, about the nuclear dangers they have created. These measures, however, do not confront the central fact that the two countries now have acquired the means to fight a nuclear war. The recent tests of Agni-II and Ghauri-II and references to Agni-III, Ghauri-III and Shaheen-I and II demonstrate just how little restraint the Lahore agreements impose on the two states continuing to develop their nuclear arsenals.

FOLLOWING the examples set over the last 50 years by the US and the other nuclear weapon states, the governments of India and Pakistan have now clearly chosen to rely on weapons of mass destruction and terror as the basis for their relationship with each other and the rest of the world. The nuclear tests they conducted in May 1998 and the accompanying political and military crisis raise genuine fears for the future of the people of south Asia. In the same way as the US and USSR did decades ago, India and Pakistan have started to turn to 'transparency' measures as a way to reassure themselves, and the international community, about the dangers that they have created. These measures, however, do not confront the central fact that the two countries now have acquired the means to fight a nuclear war. Nothing in the Lahore agreements changes this or even imposes any restrictions on it. The recent tests of Agni-II and Ghauri-II and references to Agni-III, Ghauri-III and Shaheen-I and II demonstrate just how little restraint the Lahore agreements impose on the two states continuing to develop their nuclear arsenals.

The Lahore Agreements

The agreements sketched out at Lahore are designed only to offer limited transparency and thus, it is felt, some kind of early warning that could prevent disproportionate responses from events associated with the nuclear, missile and military programmes. The two sides agreed to consult on their nuclear strategies and thinking and to notify each other about planned missile tests as well as accidental, unauthorised or unexplained incidents that could create the risk of nuclear war. There were also agreements to prevent untoward incidents at sea and to review existing communication links.

Many of south Asia's hawks, who championed the acquisition of these weapons in the first place, have welcomed the transparency measures. They have followed the American example, step by step, first in believing in deterrence and now transparency measures. They have even adopted the same turn of phrase used, over a decade ago, by Strobe Talbott who described such measures as "mutually agreeable rules of the road in the arms race – rules that will make the competition somewhat more predictable". Like Talbott, the hawks see no end to the competition.

Each one of the agreements put up for negotiation at Lahore draws directly on agreements between the US and the USSR during the early seventies.[1] The original agreements were little more than means to thin the fog of crisis that characterised superpower relations. The more significant arms control treaties, actually restricting the testing and deployment of weapons, such as the ABM Treaty, the Threshold Test Ban Treaty, Intermediate Nuclear Forces Treaty, and the Strategic Arms Reduction Treaties came later.

Moreover, the borrowing from superpower experience is partial and dangerous. As transparency measures, the Lahore agreements are limited in their scope. They do not address crucial details such as deployment patterns, command and control arrangements or early warning systems. The superpowers tried to compensate for these omissions by investing billions of dollars in spies and satellites and even more in their own early warning systems. India and Pakistan cannot resort to such expensive technological solutions both due to the lack of technological and financial resources and the fact that the geographical proximity of the two countries rules out any possibility of early warning under any circumstances.

These constraints create an additional imperative to push beyond the transparency measures that are on the table. It is here that the hawks are likely to resist. They want to see their respective states further develop and deploy their nuclear arsenals. Their response to even moderate arms control measures is likely to be similar to their superpower counterparts and characterised by suspicion and hostility. These attitudes are what has led them to support the weapons in the first place and leads them to an obsession with the possibility of cheating and thus the need for verification of any agreement.

Buying Time with Arms Control

As a way of getting to grips with the weapons themselves and recognising that the hawks have by and large hijacked the decision-making process in both countries, we suggest some small concrete verifiable arms control measures that can go beyond the transparency agreements. Like the transparency agreements, some of these steps draw upon superpower efforts during the cold war. It is difficult to justify making proposals that are so derivative and so restricted, especially given the sorry history of the cold war and superpower arms control.[2] For decades, arms control failed to restrict the size or sophistication of superpower arsenals and showed that it takes political change to achieve real results. However, in the interim it is vital to engage in measures that could help slow the momentum that has been created by the nuclear weapons tests and set the stage for a real disarmament process. We have no doubt that the fundamental problem is a political one and the long-term solutions, therefore, would lie in the political realm. Our aim is to help create time for the mobilisation of a peace movement that can challenge the elite and its way of thinking that has led the two countries to the edge of the nuclear abyss.

In trying to assess ways of dealing with nuclear weapons, it is important to be sensitive to the constraints created by the technology as well as the larger context into which the weapons as well as the

proposed forms of constraint are to work. There is no getting away from the fact that the material character of these weapons demands technical solutions of certain kinds. Just as treating these weapons as purely technical artefacts is inadequate – they are after all part of a larger social, political, scientific and military system, that creates them, maintains them and justifies them[3] – ignoring their specific technological and material nature misses out on a key way in which, as with other technological artefacts, they influence the societies into which they emerge.[4]

We divide our proposals into two – measures that would limit the potential size and destructiveness of the arsenals and measures that reduce the immediate danger to the people of the region from the existing weapons.

The Test Ban

One place where the awkward and difficult character of positioning oneself on arms control has been the tortured debate on the Comprehensive Test Ban Treaty (CTBT). Recognising the limited nature of the treaty,[5] and the fact that it allows nuclear weapon states to keep their existing capabilities while excluding other nations from acquiring the same, there are nevertheless genuine benefits that follow from a CTBT in constraining the further development of nuclear weapons.[6] It is for this reason that we, like the peace movement elsewhere, support the treaty and argue for a more serious engagement with the aspirations that guided the struggles for the treaty over the past four decades.

The coming into force of the CTBT should be supported and built on by committing to help force the nuclear weapons establishments the world over to stop further development of nuclear weapons. This would involve closing down the test sites, stopping subcritical and hydrodynamic tests, and research into a new generation of nuclear weapons. Closing the loopholes in the CTBT would put to rest the options that Indian and Pakistani nuclear weapons scientists and their international peers are trying to create for themselves to keep conducting weapons related research and development in the hope that there would be another "day the sun rose twice".[7]

Fissile Material Treaty

The other multilateral arms control measure that is under consideration is the Fissile Material Treaty (FMT).[8] This has been a priority for the nuclear weapon states, especially the US, ever since they stopped producing fissile materials themselves. Fully aware of the effects of the cutoff on its 'nuclear option', India, for a while, blocked progress on the FMT claiming that the treaty should be firmly linked to a time-bound programme for nuclear disarmament. However, in the aftermath of the May 1998 nuclear tests, as part of its efforts to ease international pressure, India relaxed its objections and has started participating in the negotiations at Geneva and has taken a similar position as the other nuclear weapon states. As negotiations develop, hard-liners in India may force renewed objections, as with the CTBT, because of the relatively small size of India's fissile material stocks.

Table 3: Pakistani Nuclear Facilities Affected by a Fissile Material Moratorium

Facility	Characteristics
Khushab	Research Reactor
Kahuta	Uranium Enrichment Centrifuge Plant
New Labs	Reprocessing plant

Table 1: Estimated Stockpiles of Directly Weapons-usable Fissile Materials[9]

Nuclear Weapon State	Weapon-Grade Uranium (tonnes)	Weapon-Grade Plutonism (tonnes)	Reactor-Grade Plutonium (tonnes)[10]
US	580	99.5	0
Russia	1050	131	33
Britain	21.9	7.6	51.3
France	25	5	35
China	20	4	0
Israel	–	0.5	0
India	–	0.33	0.45
Pakistan	0.2	0	0

Table 2: Indian Nuclear Facilities Affected by a Fissile Material Moratorium

Facility	Characteristics
CIRUS, Mumbai	Research Reactor
Dhruva, Mumbai	Research Reactor
FBTR, Kalpakkam	Research (fast breeder) Reactor
PFBR, Kalpakkam	Fast Breeder Reactor, planned
Ratnahalli	Uranium enrichment centrifuge plant
Trombay, Mumbai	Plutonium reprocessing plant
PREFRE, Tarapur	Plutonium reprocessing plant
KARP, Kalpakkam	Plutonium reprocessing plant

Currently, the main dispute is over the question of the enormous existing stockpiles of fissile material possessed by the nuclear weapon states (Table 1). The nuclear weapon states, led by the US, categorically refuse to discuss these stockpiles. Earlier this year, the director of the United States Arms Control and Disarmament Agency, John Holum, declared "we will not agree to any restrictions on existing stocks".[11] It should be obvious that leaving stockpiles untouched and banning only future production would serve no disarmament purpose at all. The non-nuclear weapon states and the non-aligned movement have recognised this; in the words of the Indonesian CD ambassador: "brushing aside the issue of stockpiles, would, once again, render the cutoff treaty a mere non-proliferation measure...[with] no added value to date".[12] India, reflecting its new found status, has opposed any discussion of stockpiles while Pakistan insists on talking about stockpiles, pointing to asymmetries in the stockpiles within south Asia as well as conventional weapons levels.[13] It is vital that pressure be brought to bear on the nuclear weapon states to include stocks in the negotiations and make the FMT into a disarmament treaty.

An Interim Production Freeze

Whatever be the scope of the treaty, negotiations are likely to take a long time. Pakistan and India may well use this time to pursue their ongoing arms race by building up their stocks of weapons useable fissile material with the attendant environmental and economic consequences. To avoid this, the two countries should declare, as with testing, a moratorium on the production of fissile material for weapons purposes. In parallel, they could call on the nuclear weapon states to publicly formalise their existing moratoria on fissile material production.[14]

The easiest way to ensure that India and Pakistan are complying with the moratorium would be for them to shut down their research reactors,[15] reprocessing and enrichment plants (Tables 2 and 3). Without reactors to make the plutonium, and reprocessing plants to extract it for use in nuclear weapons, and enrichment plants to make highly enriched uranium weapons, the two countries would no longer be able to increase their stockpiles of the raw materials for bombs. It would be relatively easy to verify that all known facilities are not being used by monitoring

them using commercial satellites or aerial observations.[16]

In a bid to keep their facilities open, the nuclear establishments in both countries are likely to claim that these facilities serve other purposes. Pakistan, for example, will say that Kahuta is meant to supply low enriched uranium for the new Chashma reactor. However, China has signed a contract to supply this reactor with fuel; there is therefore no need for Pakistan to produce its own fuel. Likewise, it has been claimed that the Ratnahalli plant in India is not capable of enriching uranium to the extent necessary for use in weapons and is actually intended to produce fuel for India's nuclear submarine. An enrichment plant can be easily modified to produce weapon-grade uranium. Further, the nuclear submarine is a colossal waste of money, and suggests only that India, like the other nuclear weapon states, intends to deploy nuclear missiles at sea – ample reasons to oppose the project in any case.

India also operates three reprocessing plants, including the recently built one at Kalpakkam, purportedly to produce plutonium for its fast breeder reactors. Quite apart from the possibility of making weapon-grade plutonium at fast breeder reactors, there are good economic and environmental reasons to stop the programme.[17] Despite these reasons, if India were to go ahead with its fast breeder programme, then it could well do so by putting them under inspections. After all the Japanese and German programmes were fully subject to international monitoring.[18]

Alongside this, they should agree not to manufacture, or otherwise acquire, tritium for use in nuclear weapons.[19] Tritium is used in order to 'boost' or increase the yield of nuclear weapons. A ban on the production of tritium would, therefore, limit the number of thermonuclear weapons that could be produced, each of which would have a destructive yield many times that of ordinary fission weapons. Such a ban would also reduce the incentive for Pakistani nuclear weapon scientists to continue pursuing a thermonuclear weapon of their own and so impede the potential for larger and more destructive weapons.[20]

A Ban on Missile Tests

As the recent tests of Agni-II and Ghauri-II show, the ballistic missile race is on and in danger of accelerating in the near future. Just as a ban on nuclear tests inhibits the development of new weapons designs, a ban on flight testing of missiles would inhibit the development of new missiles. India has conducted one flight test and continues to work on a new version of the Agni, an intermediate range ballistic missile. It is believed to be developing the Sagarika, a sea-launched missile. Pakistan, for its part, has tested a new version of the intermediate range Ghauri and is working on a new missile called Shaheen. The limited number of tests of missiles that have been conducted so far by India and Pakistan amount to experiments with missile technology; without many more tests it is not possible to deploy them with the level of confidence that military systems usually require. More tests are going to lead to growing confidence in the missiles and thus demands to deploy these missiles with the attendant increases in tension and danger.

There should be no illusion about the suggestions made above. These agreements in themselves do little to reduce the immediate danger to the people of the two countries from the current weapons. The most such measures could do is to restrict the potential devastation that could be wreaked upon them. They would also forestall an arms race between the two countries. Since leaders in both countries have stated repeatedly that they do not wish to participate in such a race, implementing these steps would be a way for the governments to demonstrate the sincerity of these statements.

Making Space with No-Deployment Zones

To address the immediate dangers another set of measures should be pursued in parallel that relate to the weapons themselves. These follow along the lines of the recent Indian resolution at the United Nations entitled 'Reducing Nuclear Dangers' that seeks to have the nuclear weapon states dealert their nuclear arsenals. What follows herein are, in a sense, an application of analogous steps in the south Asian context.

The greatest danger of nuclear war arises when missiles are deployed with nuclear warheads. It is believed that India and Pakistan have not yet placed their nuclear weapons on missiles or otherwise deployed them. This arrangement should be formalised as part of a verifiable treaty. This could be done by storing warheads at sites away from missiles and airbases. An additional benefit is that fears about the primitive and inadequate command and control systems that the two states may possess can be put to rest.

It is relatively straightforward to verify that a missile does not have a nuclear warhead without divulging any details of its construction by just looking for characteristic radiation patterns.[23] Since both India and Pakistan could deliver their nuclear weapons by aircraft, any arrangement would have to cover not just missile development and deployment, but also airbases. Airbases would have to be opened to inspectors, periodically and when challenged, who could look for storage sites for nuclear gravity bombs as well as observe aircrafts to ensure that their bomb bays have not been altered to allow loading of nuclear bombs. Such inspections have been conducted as part of the START I treaty by Russia and the US.[24]

The very short flight time of missiles allows no time for any response other than immediately launching one's own missiles in the event of a warning. Thus it is important to increase the time for the two

Table 5: Number of Prithvi Missiles Required to Damage a Single Airbase, Command Centre, or Radar Using Conventional Warheads as a Function of Accuracy

Accuracy (M)	Airbase	Command Centre	Radar
50	96	16	2
100	168	63	3
150	256	140	6
250	512	393	13
300	672	558	18

Table 4: Ballistic Missile Systems under Development or Production

Name of Missile	Range	Warhead Size	Development Stage
Indian Missiles			
Prithvi-I	150 km	1000 kg	Deployed
Prithvi-II	250 km	500 kg	Developed
Prithvi-III	350 km	250 kg?[21]	Under development
Agni-I	1500 km?	1000 kg?	Technology demonstrated
Agni-II	2500 km	1000 kg?	Technology demonstrated
Sagarika	300 km?	500 kg?	Under development
Pakistani Missiles			
Hatf-I	80 km	500 kg	Technology demonstrated
Hatf-II	300 km	500 kg	Technology demonstrated
Hatf-III	up to 800 km	500 kg	Technology demonstrated
M-11[22]	290 km	1000 kg?	In storage?
Ghauri	1500 km?	700 kg	Technology demonstrated
Shaheen	700 km?	1000 kg?	Displayed

countries to respond. This is made more difficult by the missiles already inducted in to the armed services, namely, the 150-250 km range Prithvi and possibly the 290 km range M-11 missiles. Due to their short ranges, if they are to be deployed, there is no alternative but to put them close to the border.

Despite the claims made about them, there is little military value of relatively inaccurate missiles. Prithvi, which is said to have an accuracy[25] of 150 m when fired up to a distance of 150 km, would need to be used in extraordinarily large numbers if armed with conventional, non-nuclear warheads and used to attack the kinds of targets it is said to be intended for.[26]

There are two consequences that follow from the characteristics of these missiles. If they are deployed in small numbers, as they are currently, they are likely to be seen as carrying nuclear warheads and so elicit a similar response. If they are deployed in large numbers, even with conventional warheads, they are likely to be seen as a first strike weapon, and capable of launching a surprise attack. This may well elicit a greater determination to use nuclear weapons very early in a war, before they are destroyed – the classic 'use them or lose them' problem. In view of these dangers, Pakistan and India should agree to move their missiles away from the border to a distance greater than their respective ranges.

The control by hawks over the policy-making process in the two states makes it likely that any agreement will confront accusations that the other side is likely to cheat and the means available to detect such cheating are limited, if not absent. However, there are many ways by which compliance may be overseen. There are several technologies based on experiences with the verification of treaties like the START, INF and Open Skies treaties. One possibility would be for a single co-operative monitoring centre, or two co-located ones, with international commercial satellites[27] providing Indians and Pakistanis identical high resolution imaging data from a several hundred km wide swath on both sides of the border. The exact width of the swath could be such as to ensure that neither Prithvi nor the M-11 could be deployed close enough to the border to be able to threaten significant areas of the other state without being detected. An alternative to using satellites is to rely on joint aerial observation flights.[28]

A second more robust and economical possibility is moving all missiles to designated, monitored storage sites that are to be located outside this no-deployment zone. Sensor systems can be deployed around these sites to detect any movement of the missiles outside the restricted area.[29] These can be combined with a system of electronic tags associated with each missile. The tags would send out regular signals that would allow the other party to know when one of the missiles has been moved beyond the storage site. These technologies can be complemented with a system that allows challenge inspections of these designated sites, especially if there is evidence of prohibited activities.[30]

Asking the international community for help with setting up such monitoring mechanisms would be a useful contribution to peace.[31] In contrast, attempts to obtain dual-use technologies in the case of India or purchasing expensive arms in the case of Pakistan are only likely to fuel suspicion and further the arms race at the level of research and development if not weapon systems.

Conclusion

At a time when the search is on for the rules of the nuclear road, it is important to appreciate that it is the hawks who have their foot on the accelerator and their hands on the steering wheel. What is needed are initiatives from the peace movement rather than hand-wringing after every nuclear and missile test. These initiatives must recognise that at the present moment the peace movement is not in any position to try to take control the car and bring it to a stop (and put the people on a bus that goes far beyond Lahore).

Political parties, in the current climate, have little experience or technical knowledge and are surrounded by advisors and so-called experts from the nuclear-scientific-military-industrial complex who are setting the limits of the debate. Not surprisingly, they are then able to pass of the most limited suggestions as proof of their commitment to peace. It is the responsibility of the peace movement to provide more robust and reliable measures that can gauge the reality of these commitments. The agreements suggested here also offer ways of testing the sincerity of India's offer of a No-First Use Treaty[32] and Pakistan's offer of a Non-Aggression Treaty.[33]

We recognise the limitations of the proposals listed here and intend them only as ways of buying time. Even this time will not be without risk. The only certain way to prevent the possibility of nuclear war in south Asia as elsewhere is the absolute and unconditional abolition of nuclear weapons. The urgent task is to engage in the political work that will put peace at the top of the agenda.

Forestry Research in India

Tapan Kumar Mishra

In colonial times, forest management in India meant only commercial exploitation of forest resources. After independence, conservation did become a goal. But forest management remains bureaucratised. Forestry research receives only a small part of plan allocations. Funding is often decided on purely technical criteria with no reference to local community needs. Production potential, limits to sustainable extraction and impact of the market must be considered when prioritising forest research activities.

A MAJOR change in the policy of forestry research in India has been from its quantity orientation to quality orientation. Previously forestry research emphasised revenue but now it advocates stress on environmental aspects. This has been reflected in the Indian Forest Policy, 1988. India has not been able to make significant progress in conserving its forestry resources and in deriving best results from the vast natural resources it possesses. This is not due to lack of efficiency of our scientific manpower but is largely due to neglect of research amenities connected to this field. A bill put before the parliament cannot do much without the will to implement. This has been lacking. The agenda set before our forestry research institutions has been half-hearted and aimless. The attitudes of colonial times persist.

Historical Background

Organised forestry activity began in 1864, when imperial forest department was established in India. Brandis was brought from Germany to look into the process of forest resource management in India. He was required to help commercial exploitation of forest resources rather than resource management. As Gadgil and Guha (1992) point out: "Walking a tightrope between the imperatives of colonial administration and the claims of social justice, Brandis, quite remarkably for his time and milieu placed considerable trust in the ability of village communities to manage their own affairs. Displaying an early 'ethnobotanical' interest in indigenous system of tree and plant classification, he circulated a list of local names, urging the younger officers, with more leisure and more extensive opportunities, to take up the study of the names of the trees and shrubs used by the tribes of central India."

In 1901 a small research laboratory was established in Dehradun to study certain soil properties of forests. It took no less than 37 years since the establishment of the forest department to feel that the status of forests has to be studied scientifically along with the extraction of resources. After another five years, i e, in 1906, the Imperial Forest Research Institute (IFRI) was established in Dehradun adding some new branches to the soil laboratory established in 1901. The present building of Forest Research Institute (FRI) was completed in 1929 where the then IFRI was housed.

After independence, IFRI was renamed FRI. This was the only national institute engaged in foresty research in India at the time of independence. Research in natural resources needs a database of depletion and distribution of resources. For this, two other national level institutions were established: Botanical Survey of India in 1890 and Zoological Survey of India in 1916. Subsequently, some important national organisations such as Forest Survey of India (FSI), Wildlife Institute of India (WII), National Botanical Research Institute (NBRI), National Bureau of Plant Genetic Resources (NBPGR) and some other regional and ecosystem level organisations were established for biodiversity research. In spite of all these efforts, resource inventory is a major need in forestry research of India. Only some commercially important resources have been documented. It has been rightly pointed out by many workers that an indepth study of biodiversity of India is urgently needed. There is no functional co-ordination between the national institutes for biodiversity research. Basically biodiversity research has not been of political interest in India, and does not draw attention of policy-makers. Up to 1985 forests were under the jurisdiction of agriculture ministry, government of India. The inevitable consequence of this overlapping was, in the First Five-Year Plan only 1/34th of agricultural allocation was earmarked for forestry. After the ministry of forestry and environment was separated from agriculture ministry in 1985, the allocation increased marginally. In the Eighth Five-Year Plan forestry

allocation was one-tenth of agriculture allocation. The share of forestry research was only 2 per cent of the total allocation for the ministry prior to Eighth Five-Year Plan period. In the Eighth Plan this allocation was increased to 6 per cent. These figures indicate the importance given to forestry research and management in India.

In the 1988 Indian Forest Policy, emphasis of forestry research was on increasing forest productivity on the one hand and community forestry on the other. The policy lays stress on better database preparation and clearly states "Priority needs to be accorded to completing survey of forest resources in the country on scientific lines and to updating information." The policy also points out that without the investment of financial and other resources on a substantial scale, these objectives cannot be achieved.

After independence some other institutes of forestry research were established. In 1956 a regional research centre was established in Bangalore. Afterwards three regional centres were established: at Coimbatoor in 1958, at Jabalpur in 1972 and at Jorhat in 1976. During the early 1970s not less than 17 small centres of Forest Vegetation Survey were established throughout the country. A considerable amount of finance was made available by the World Bank to develop the capabilities of forestry research in India. Indian Council of Forestry Research and Education (ICFRE) was established with its headquarters at Dehradun in 1991. Under this national body nine institutes and one advanced centre for forestry research were established in various regions of India. Thus, a meaningful, though still inadequate advancement was made in forestry research in India.

Causes of Concern

Never has forestry been an area of priority in India. The priority was sometimes industry and sometimes agriculture. There is no doubt that forests contain more biodiversity, so far as macro flora and fauna is concerned, in comparison to any other ecosystem. India is a megadiverse country and houses not less than 45,000 plant species and 75,000 animal species. At least 7,000 of these plant species are indigenous. The flora of India is greatly influenced by Indo-Malaysian, Eurasian and Tropical-African vegetation. We have 65 national parks and 426 research forests constituting in 25.45 million hectares (4.1 per cent) of total land area fully dedicated for preserving biodiversity. Besides these the country has 14 biosphere reserves with their unique ecosystems and covering about 1 per cent of the total land area of the country. In spite of all these efforts every year we are losing not less than 25,000 hectares of forests, of which 3,000 to 4,000 hectares are being lost due to mineral exploitation alone. After independence we had two forest policies in 1952 and in 1988 to cope with the national needs. After 1927 Forest Act, we had Wildlife (Protection) Act of 1972 and Forest (Conservation) Act of 1980 to check depletion of forest resources.

Search for Consonance

Consonance is matching research capability of a researcher with the research needs of an area. The increasing range of forestry research and the equally diverse worldwide demand on the elements of biodiversity are the major causes why such consonance is needed. The present trend is to fund research judging merit without reference to local needs. ICFRE is not the only organisation which is conducting or funding forestry research in India. Several other organisations continue to fund research. So it is necessary to keep a record of all research activities in progress.

Participatory mode of fixing research priorities is not a usual practice in our country. This participation refers to participation of the community. ICFRE is trying to fix research priorities involving state forest departments and a few scientists who work outside the institute. Here, questionnaires are circulated in a workshop, and from these individual sheets selected areas of research are ranked as per the individual scores obtained. However this exercise does not involve field level working scientists in decision-making process of framing forestry research policy in India. In West Bengal, when such as exercise was going on, though some handful of scientists were invited to take part, organisations like Botanical Survey of India, Zoological Survey of India were not involved for some reason or other. These institutes have their headquarters at Calcutta and no doubt are the most important organisations in identifying biodiversity resources of our country. Thus, such discussions are generally dominated by forest department officials, who can better be called as forest bureaucrats, and who since the inception of forestry activity in India are engaged in determining priorities of forestry research in India. It will be pertinent to mention here that forestry research in India has attracted only about 500 researchers.

The need of forestry research at present is a much broader approach, where the community around forests has to be involved in framing research priorities. Since 1988, 21 states of India have taken initiatives to launch joint forest management involving communities around forests. Though performances of different states vary, not less than 20,000 forest protection committees now exist managing about 30,00,000 hectares of degraded forest land of our country. The experiences of people regarding forest management, which may be termed as 'indigenous knowledge', has found a place in the day-to-day management of our forests. Any priority setting exercise of forestry research has to give due importance to these micro-level management decisions, which are mostly based on the resources existing already within our ecosystems.

Research Needs

Essentially forestry research in India has to be conducted at two different levels: (i) conservation level and (ii) day-to-day management level. At the conservation level, human intervention in the forest ecosystem is unwanted, whereas, at the management level human intervention is a must. The two levels may be contradictory but the policy-making national level research organisations have to find a balance between the two. Neither of the two levels can be ignored. Conservation being a management strategy, is often confused with preservation. The prevailing idea in the forest bureaucracy is that conservation is the sole prerogative of the state. Being influenced by this notion, policing capability of the forest department has been regularly geared up. Thus the concern of ecosystem people regarding their own natural resources is undermined. It is a utopian idea that people would prefer to preserve their ecosystem even if they go hungry. A meaningful conservation can be expected only when a community is given some rights on extraction from the ecosystem they conserve. Here comes the need of sharing benefits. This will certainly vary from ecosystem to ecosystem but not necessarily from state to state. The issues covering bilateral matching of institutions, sharing of benefits, specific sharing of management responsibilities and capacity building of institutions are to be standardised by the researchers.

In day-to-day management affairs many intricate questions are to be addressed by the researchers as these will influence the ecosystem directly. These include water management, biomass management, etc. These questions are technical in nature and a populistic demand for bestowing responsibilities may cause permanent damage to the ecosystem. While considering this aspect,

one should be careful that in no situation would any management decision be responsible for divorcing culture of the forest fringe community from the nature surrounding them. The civilisation of India, nurtured by nature, is mostly biomass based. There cannot be a general prescription for exploiting much needed biomass as ecosystems vary from place to place and even from time to time. If joint forest management is a strategy for conserving forests of India, maximum emphasis on non-timber forest produce is to be given. Studies on production potential [Mishra 1998], sustainable limits to extraction and intervention in the present market system of such resources are essential. All these are to be considered while prioritising research activities.

UP Finances: Budgetary Illusion and Reality

Ajit Kumar Singh

The Uttar Pradesh state budget for 1999-2000 presents a rosy picture of the state's financial situation by manipulating figures of budgetary receipts and expenditure. In reality, all major fiscal indicators show a sharp deterioration in state's finances.

FOR quite sometime the financial position of the Uttar Pradesh government has been in the doldrums, as in many other states. The fiscal profligacy of successive governments, facing short and uncertain tenures, combined with a singular lack of political will to tax the rural and the urban rich has landed the state into an unmanageable fiscal crisis. This is reflected in unsustainable and high levels of revenue and fiscal deficits, mounting debts and interest burden, and increasing resort to withdrawals from the 'public account' including reserves and employees' provident funds.

Nearly all the major fiscal indicators show a continuous worsening of the situation (Table 1). Total expenditure as a proportion of SDP has steadily increased from 19.82 per cent in 1996-97 to 26.96 per cent in 1998-99. On the other hand, revenue receipts have stagnated at around 13.5 per cent of SDP, while tax-SDP ratio has remained at the low level of 5.5 per cent. The state government has been forced to borrow increasing amounts even to meet its revenue expenditure. Total indebtedness of the state government is now nearly two-fifths of state income. Fiscal deficit is likely to touch the figure of 7.9 per cent of SDP in 1998-99, while revenue deficit is estimated to be 5.7 per cent of SDP. These figures are much above the average figures for all the states.

To meet its mounting expenditure the state government is resorting to the unwise policy of withdrawals from the public account which represents reserves and employees' provident fund. The drawing on the 'public account' amounted to a hefty Rs 3,474.16 crore in 1997-98 and Rs 3,743.77 crore in 1998-99.

The precarious situation of the state finances is reflected in the fact that the government had to depend heavily on the ways and means advances from the Reserve Bank of India (RBI) which touched the level of Rs 8,000 crore in 1998-99. This amounts to 42.5 per cent of the revenue receipts of the government and 28.6 per cent of its total receipts from all other sources. In other words, the RBI had to bale out time and again the cash strapped UP government throughout the year. The central government, headed by the same party which is ruling the state, also lent a helping hand by raising the level of central assistance from Rs 2,166.53 crore in 1997-98 to Rs 3,120.15 crore in 1998-99.

Alarmed by the fast deteriorating fiscal situation, the state government took the unusual step of issuing a white paper on the fiscal situation in the state along with the budget of 1998-99, admitting that the state is almost in the grip of a debt trap. It would be appropriate to examine the budget for 1999-2000 presented by the chief minister Kalyan Singh, who also holds the finance portfolio, to the state assembly on February 19, 1999 in the above context.

The chief minister acknowledged in his budget speech that the state is presently in a state of financial crisis but put the blame on the previous governments for the lack of fiscal discipline and their inability to raise additional resources which have led to the crumbling of the fiscal structure of the state. The chief minister expressed his determination to reverse the unhappy past trends to give a right direction to the state finances by bringing down the proportion of the fiscal deficit from 7.9 per cent of SDP in 1998-99 to 6.3 per cent of SDP in 1999-2000. A close scrutiny of the budget proposals in the light of the past trends would belie these claims.

The budget projects a total expenditure of Rs 40,754.04 crore for 1999-2000 including Rs 29,761.88 crore on revenue account and Rs 10,992.16 crore on capital account (Table 3). Receipts for 1999-2000 have been projected at Rs 37,294.78 crore – Rs 22,831.06 crore on revenue account and Rs 14,463.72 crore on capital account. In spite of the claims to restraint expenditure, revenue expenditure is likely to go up by Rs 2,295.99 crore over the previous year out of which Rs 1,530.66 crore would be only on salary head. On the other hand, capital account expenditure is projected to go down by Rs 2,664 crore over the previous year on account of lower projected reliance on RBI ways and means advances which is placed at Rs 5,000 crore.

Revenue receipts are projected to go up by Rs 4,031.04 crore, but capital receipts are likely to go down by Rs 2,387.70 crore due to lower projected drawing on ways

TABLE 1: MAJOR INDICATORS OF FISCAL SITUATION IN UP, 1996-2000

(Per cent of SDP)

Item	1996-97 Actual	1997-98 Actual	1998-99 BE	1998-99 RE	1999-2000 BE
Tax revenue	5.38	5.38	6.14	5.30	6.02
Revenue receipts	13.68	13.52	13.43	12.33	13.14
Revenue expenditure	16.39	17.08	18.08	18.01	17.12
Revenue deficit	2.71	3.56	4.65	5.68	3.99
Capital receipts	4.49	5.39	6.18	11.29	8.32
Capital expenditure	3.43	4.42	4.61	8.95	6.32

Fiscal deficit	4.60	5.83	7.02	7.93	6.30
Primary deficit	1.20	1.95	3.57	4.03	2.33
Interest payment	3.50	3.88	3.45	3.90	3.97
Total indebtedness	35.63	37.21	38.70	38.25	39.10

Source: UP government, *Annual Financial Statement for 1999-2000 and Brief Review of Financial Situation, Budget Papers*, Vol II, Part I.

and means advances from the RBI. In spite of an optimistically higher receipts, the government expenditure will exceed its receipts by as much as Rs 3,459.26 crore, requiring a withdrawal of Rs 3,080.28 crore from the 'public account'. Even then the government will be left with a deficit of Rs 772.63 crore, after taking into account the opening negative balance of Rs 393.65 crore.

Let us examine how realistic are the budget figures. Of late, both state and central governments are resorting to the practice of showing a rosier picture than warranted by facts through a process of what has been aptly described as 'creative arithmetic'. Budgetary receipts are deliberately overestimated while anticipated expenditure is underestimated. Thus, total expenditure, which had shown a run away growth of 20.2 per cent in 1997-98 and 47.2 per cent in 1998-99 is projected to decline by 1 per cent in 1999-2000. Similarly, revenue expenditure which had increased by 15.6 per cent and 23.7 per cent in 1997-98 and 1998-99 respectively is estimated to go up by only 8.4 per cent next year. Capital expenditure which had shown an abnormal jump of 138 per cent in 1998-99 is actually expected to go down by 19.5 per cent in 1999-2000 due to lower recourse to ways and means advances from the RBI assumed for next year, a questionable assumption given the precarious state of the state finances.

Equally unrealistic are the projected receipts for the next year. Revenue receipts, which had shown a modest increase of 9.6 per cent and 7 per cent in 1997-98 and 1998-99, have been projected to suddenly jump by 21.4 per cent in 1999-2000 even when no additional resource mobilisation measures have been proposed in the budget.

The casual way to budget formulation is reflected in the way targets for revenue from state taxes are fixed. Thus, revenue from state taxes is expected to go up by as much as 29.3 per cent next year, against an actual increase of 11 per cent in 1997-98 and expected increase of 15.6 per cent during 1998-99. The unrealistic nature of revenue targets in the budget estimates will be clear from a look at the gap between the projected increase in tax revenue and the actual receipts in the previous year. Thus, the revised estimate for state tax revenue during 1998-99 was 8,090.19 crore against the proposed target of Rs 9,369.49 crore, i e, a shortfall of Rs 1,279.30 crore (Table 4). The shortfall in receipts over budget estimates was Rs 721 83 crore in case of sales/trade tax, Rs 298.40 crore in stamp and registration fees and Rs 217.60 crore in goods and passenger taxes. Unmindful of its own performance in the current year, the state government has again fixed unattainable targets for the next year. For instance, state excise duties are expected to fetch an additional Rs 562.58 crore when the industrial output in the state has been nearly stagnant for several years.

In spite of the rosy picture presented in the budget, the situation still presents a deterioration in nearly all the major fiscal indicators when compared with the year 1997-98 (Table 1). The slippages in fiscal targets observed during 1998-99 are not likely to be reversed next year. In all probability the fiscal crisis in the state would further deepen during 1999-2000, casting serious doubts on the claims of the chief minister that the revenue and fiscal deficits as per cent of SDP would go down and the undesirable financial trends observed in the last decade would be reversed.

TABLE 2: TRENDS IN REVENUE AND FISCAL DEFICIT IN UP, 1991-97

Year	Revenue Deficit		Fiscal Deficit	
	Rs Crore	As Percentage of SDP	Rs Crore	As Percentage of SDP
1991-92	724.59	1.1	2,836.50	4.4
1992-93	1,014.56	1.4	3,710 93	5.2

Bill Gates in the Dock

Anti-Trust Case against Microsoft

Prabir Purkayastha

One of the measures that the US justice department is contemplating, in its anti-trust case against Microsoft, is compulsorily licensing Microsoft products to others to break its monopoly. This is in sharp contrast to the strenuous US opposition to compulsory licensing under the WTO framework.

THE Microsoft anti-trust case filed by the US justice department has drawn very little interest in India. Yet it is a landmark case, involving as it does not only the largest company in terms of market capitalisation in the world but also a number of vital issues. Interestingly, one of the measures that the US justice department is contemplating is compulsorily licensing Microsoft products to others in order to break its monopoly. This may be contrasted with the US strenuously opposing compulsory licensing under the WTO framework.

The use of compulsory licensing is to prevent companies who have monopoly from fleecing consumers. In the pharmaceutical industry, the needs of the consumer for life-saving drugs can be used by the drug companies who hold patents to increase prices to very high levels. Thus AZT, a drug used for slowing down the effect of AIDS, was priced initially above $ 50 a dose before AIDS victims launched an agitation to bring down the price. When a monopoly producer sets prohibitive prices for its patented drug, the state has the right to license its product to another company and ask the company to pay a reasonable royalty to the patent holder. This is to ensure that public good can be ensured even under a patent regime. However, this is precisely the provision that has come under attack in the new Intellectual Property Rights regime under WTO and countries such as India are being asked to drop such provisions from their patent laws. Faced with monopoly of the Microsoft variety, the US justice department is finding now a lot of merit to compulsory licensing.

Microsoft is currently the world's largest business. Its size alone makes it of global importance. Even more important, as computers enter all fields – writing, games, calculations, complex systems running plants and business, communications, etc – whoever owns the software that drives all machines on the Internet will virtually rule the world. Internet is not only a gateway to information and games; tomorrow it can be the medium through which we get TV and films and transact business. Already, electronic commerce has become the hottest property in the market with companies such as Amazon.com – the electronic booksellers – reaching market capitalisation of tens of billions in only a few years. Thus we are talking about a structure of the world that merges all forms of communication and commerce. In this, Microsoft has not only set alarm bells ringing in the computer industry but all across the world. Whoever dominates the software market, could pry open other markets through this dominance. That is why the current trial is not only important for the computer world but for future of American business, and along with it for international business.

This specific anti-trust case arose out of Microsoft's attempt to capture the Internet browser market by bundling Microsoft's Internet Explorer with Windows 98, therefore shutting out Netscape Navigator, its competitor's product. The case has gone badly for Microsoft. It has brought out how Microsoft used its market power to destroy competition and arm-twist PC manufacturers to carry only its products. Its experts have been caught lying; two videos presented by Microsoft to prove its case have been found to be doctored, and senior Microsoft officials have admitted that if the Internet Explorer was presented side by side with the Netscape Navigator, most people would choose the Navigator. The case has also brought out the obsession of Bill Gates, the founder of Microsoft, to own every facet of software including the Internet.

Perhaps the defining moment of the courtroom drama was when James Allichin, a senior vice-president of Microsoft, admitted that the video he was using to show that the Explorer cannot be taken out from Windows 98 without problems was rigged. Professor Felton of Princeton University had developed a software programme for the Department of Justice (DOJ) and had testified that the Explorer could be removed from Windows 98 without disturbing its integrity or performance. Microsoft in turn presented a video showing how this software degraded the performance of the operating system. Unfortunately for Microsoft, David Boise, the Justice Department's star prosecutor, played the video frame-by-frame and showed where a title bar suddenly changed in the middle of the test, proving that the video was doctored. This blew a big hole in the Microsoft case that the Explorer was an integral part of the operating system and therefore needed to be bundled with the operating system.

When IBM had launched its PC, it asked Microsoft to write a new operating system to drive these machines. The MS-DOS was the result. IBM, as it was entering the PC market well after companies such as Apple and Sinclair, had to use all off-the-shelf components for its PC line. Therefore, it was an open architecture – anybody could copy it. Bill Gates gambled that others would and sold IBM the rights to MS-DOS at a very low price. He, however, retained the right to sell it to others. IBM found this to be attractive and made MS-DOS their standard PC operating system. IBM PC was able to power its way to make itself the industry standard. However, this did not help IBM much as IBM clones soon flooded the market. As these clones – IBM compatibles – grew in numbers, MS-DOS became a hot selling product. And while IBM took a beating, Microsoft grew in strength.

However, the MS-DOS story was only the beginning. Microsoft developed OS/2 for IBM and soon after entered the market on their own with Windows in 1991. Both were very similar. Not surprisingly, IBM accused Microsoft of bad faith and broke its long partnership with it. However, after having ridden piggyback on IBM, Bill Gates was willing to take them on. OS/2 was a dismal failure as all IBM's competitors flocked to Windows. After all, IBM was the big bad monopolist to fear and had all along used its market power to keep competitors out. What the PC makers did not realise was that they were creating an even bigger monopoly by backing Microsoft. Today, with its enormous market power, it is Microsoft that is dictating terms to all the hardware manufacturers.

The operating system is the software layer that lies between any software that you run and the machine. Thus, if you are doing word processing or using a spread sheet, the access to the machine is provided by the operating system. Obviously, Microsoft would have a head start over all others as it was the one who had developed the operating system. However, this was only one use Microsoft made of its ownership of the operating system. There were two other strategies that Microsoft followed. One was to bundle applications with the operating system; the other was to force the PC vendors to pay a licence fee to Microsoft for each PC sold by the vendor, irrespective of whether each PC carried its operating system or not.

The anti-trust wing of the DOJ had been receiving numerous complaints about Microsoft's monopoly and restrictive practices. However, they were loath to move

against Microsoft as it brings in enormous revenues from across the globe. More than 50 per cent of its revenue is from outside the US. DOJ filed a suit against Microsoft in 1994 which they immediately settled through an agreement. The main contention of the suit was that Microsoft was forcing PC manufacturers to license as many copies of Windows as they sold processors. Thus if the customer did not want his PC to carry Windows, he would still have to pay for the cost of Windows. Though the settlement prohibited processor-based licence, the loopholes in the agreement has meant that even three years after the settlement, no one in the US can buy any standard branded PC without buying Windows. The second part of the settlement was that Microsoft would not bundle other software in a way that competitor's products would get squeezed out. This is the issue right now before the court.

Microsoft had earlier used devices such as bundling (word-processing, spread sheet, database being bundled together as a suite, the Microsoft Office) and killing competitive lines of software. However, there was one area that Microsoft neither anticipated nor had any strength. This was Internet, where an explosive growth left Microsoft with the realisation that a whole new technology, of which it had no part, was being born. As more and more net applications sprung up, Microsoft realised that it was missing the Internet bus. Microsoft not only threw in its resources to create its web browser – the Internet Explorer – but also did two other things. After an initial period of competition that saw the Explorer come off as a poor second, it decided to give away the Explorer free. Not satisfied with this, it also decided to bundle it with Windows 98 – something that the agreement of 1995 was supposed to prevent. They also threatened all PC manufacturers that they would discontinue all Windows sales to them or raise their Windows prices if they took out the Explorer icon or ported a competitor's product. The explicit target was Netscape, which had the major browser market share. Irrespective of the result of the court case, Netscape has thrown in the towel and has now been acquired by America On Line, which itself is becoming a monopoly Internet Service Provider in the US.

The informed guess is that the district court judge hearing the case, Thomas Penfield Jackson, is going to rule against Microsoft. If he does so, and assuming that his judgment stands in the appeals that Microsoft is likely to file, what are the likely courses of action for the justice department? There are three options that are open. The first is to break up Microsoft into three or more companies – a set of 'baby Bills' – compulsorily licensing all existing Microsoft software to these 'baby Bills'. The second is to break up the operating system business from the rest of the software business. The third is to impose regulatory checks on Microsoft: a course of action that the justice department had tried earlier and failed. Thus, if Microsoft loses the legal battle, we are more likely to see the first or second option being tried. Instead of one Microsoft, we might have two or more Microsofts.

While two Microsofts may be better than one, the very size that Microsoft has now reached would mean that no competitor would be even close in size to the new 'baby Bills', ensuring an oligopoly. This is the limitation of the so-called anti-monopoly legislation where oligopolies are assumed to be adequate for competition. In practice, this rarely works in the consumers' favour as simple 'arrangements' between the large players easily bypass all anti-monopoly restrictions. Nevertheless, the Microsoft case brings out the real face of monopoly. It is not innovation and quality of its software that has made Microsoft the only software player for the PC market: it is its predatory practice and sheer blackmailing power.

Grand Old Man of the Socialist Fringe

Mama Baleshwardayal

Rahul

Unlike other intellectual stalwarts of the Indian socialist movement, Baleshwardayal Dikshit, popularly known as Mamaji, remained rooted to the bhil homeland and continued to give leadership to one of the most sustained but least publicised of peasant movements till the ripe age of 91.

WITH the passing away of Baleshwardayal Dikshit popularly known as Mamaji at the ripe age of 91 at his Bhil Ashram in Bamnia village in Jhabua district of Madhya Pradesh on December 26, 1998, the last surviving and most unique of the stalwarts of the first generation of socialists in India is no more. Mamaji, who had earlier declined a freedom fighter's pension considering it to be absurd to accept monetary compensation for patriotic deeds, refused to be treated in elite medical institutes of the country during the last two years of his life, when some of his organs had been severely affected by repeated attacks of malaria, saying that he would not avail of any facilities that a common bhil tribal could not get.

Mamaji was born in Niwari village of Etawah district of Uttar Pradesh in 1907. While in school he was influenced by the non-cooperation movement in 1921 and beat up a British teacher who spoke ill of Gandhi and was rusticated from school. His father Pandit Shivshankar Dikshit was a martinet and school-teacher himself, and so fearing his wrath, the teenaged Baleshwardayal fled to his maternal uncle's place in Khachrod near Ujjain in Madhya Pradesh. His uncle who was an inspector of co-operatives began training him in the working of co-operatives as a prelude to getting him a job in the co-operative inspectorate. Things were progressing sedately when Mamaji read in the newspapers that Gandhi had gone on a fast to get admission for untouchables into the Guruvayur temple in Madras.

Immediately Mamaji hatched a plan with some of his friends to organise the recital of a Satyanarain Katha at the end of which prasad would be distributed by untouchables. The katha was held and as planned prasad was distributed by untouchables. The upper caste devotees could not possibly refuse the divine prasad and so had to accept it. There was a furore afterwards, however, and once again Mamaji had to seek fresh pastures. He went to Bhabra in Jhabua district in 1931 on having invited by Chandrashekhar Azad's mother. He assumed the principalship of a local school in Thandla when the post fell vacant in 1932.

At that time most of the bhil homelands in western Madhya Pradesh, eastern Gujarat and southern Rajasthan were under the rule of jagirdars or small princes. There were only some pockets of British ruled territory like Panchmahals. The bhils had to bear the dual oppression of these feudal rulers and the sahukars or moneylenders. Mamaji started off by giving admission to bhil students in his school. He soon found that just providing education was not enough and more basic socio-economic reforms were necessary. So he got like-minded people together to form a 'praja mandal' or citizen's council. There was a severe drought in 1933 resulting in widespread crop failure. An appeal for providing relief drafted by Mamaji was published and circulated by the praja mandal in which the bhil farmer was referred to as 'annadata' or giver of the daily bread. This angered the ruler of Jhabua who contended that as the ruler only he could be the annadata and he had the signatory of the appeal Seth Soubhagmal arrested and paraded hand-

cuffed through the streets of Thandla. Mamaji led the praja mandal in a massive agitation against the prince which led to his removal by the British in 1934. This started off the movement against the despotic rule of the princes all over the region. The bhils under Mamaji's leadership started a long-drawn struggle against the practice of doing 'begaar' or free labour on the land of the princes.

Simultaneously, a movement was started against the usurious practices of the sahukars in 1934 which went on till 1937 gaining substantial success On the occasion of the 25th anniversary of the ascent of King George V to the throne of Britain in 1936, the British had ordered that all schools should celebrate the event. The Thandla school students and the praja mandal instead passed resolutions against the oppressive rule of the British. This led to a crackdown and widespread arrests under the Defence of India Rules. Mamaji who had gone to Etawah to be married to Savitri had to rush back cutting short his honeymoon and had to cool his heels in Jhabua jail instead. After his release he set up the Bhil Ashram in Bamniya village on the Delhi-Bombay rail route. This place was chosen strategically as it was on the border between the princely state of Jhabua and the British-ruled territory of Panchmahals. He was immediately involved in the derailment of a train and so used to move across the border frequently to avoid arrest.

The second phase of the anti-begaar movement was launched from Bamnia in an extremely quaint manner in 1941. Mamaji found that there was a rule in the princely states that kshatriyas and brahmins could not be made to do begaar. Agitations alone were not being effective enough in abolishing begaar. So Mamaji wrote to and got the sanction of the Shankaracharya of Puri to hold a massive religious congregation in Bamniya in which the bhils performed 'shuddhi' in large numbers and wore the 'janeyu' or sacred thread to become kshatriyas. This proved very effective as the hold of religion on the princes was very deep and they could not possibly defy the Shankaracharya and not recognise the bhils as kshatriyas. Vast numbers of bhils were freed from serfdom and the movement assumed massive proportions. The first time I met Mamaji in 1987, the first thing he did was to relate this story amidst guffaws of laughter. The princes began to go back to their dirty ways after some time, however, and so the struggle continued. Even after independence 'jagirdari' was not abolished and the movement was intensified with renewed vigour. Mamaji dashed off a stern letter to Nehru castigating him for reneging on his promises. Nehru had him incarcerated to Tonk jail for his pains in 1948. He was released after eight months following the intervention of the then governor-general Rajagopalachari. The jagirdari system was finally abolished only with the adoption of the new Constitution in 1951.

From the late thirties onwards Mamaji came into contact with the towering leaders of the Indian socialist movement like Rammanohar Lohia and Acharya Narendra Dev. He became a socialist too. Unlike these intellectual stalwarts, however, he remained rooted to the bhil homeland and continued to give leadership to one of the most sustained and unique but little publicised of peasant movements that this country has witnessed. The influence of this movement can be gauged from the fact that the Socialist Party swept all the seats of the region in the first election of 1951. Following independence, to emphasise the socialist character of the movement symbolically, the practice of wearing lal topis (red caps) by members was introduced. The subsequent movement, which came to be known as the Lal Topi Andolan as a consequence, concentrated on securing for the bhils the right of access to forest lands which had been denied them by the new independent government's extension of the Indian Forest Act 1927 to the region. This movement continued till the late fifties before beginning to wane.

The subsequent demise of the Lal Topi Andolan and the marginalisation of Mamaji from the mainstream political arena has a lot of lessons for those engaged in grass roots battles for the emancipation of the oppressed. Bowing to the wishes of the national leaders of the Socialist Party, Mamaji began to devote more time to electoral politics than in building up a formal, ideologically committed and cadre-based structure for the Lal Topi Andolan that could sustain it over a long period. The Congress Party and the bureaucracy soon began wooing the elected tribal leaders of the Socialist Party with various bribes. It was not long before some of these leaders went over to the Congress and took with them substantial members of the movement. Once this split was engendered, tremendous police repression was unleashed on those members who remained loyal to the movement. The movement lost its momentum almost totally in Jhabua. So terrifying was the memory of this repression that even two decades later when a process of mass organisation was again being started by us in Jhabua in the mid-eighties, we had tremendous difficulty in convincing people that fighting for their rights in an organised manner was a feasible project.

Centralised electoral politics and grass roots mobilisation around livelihood issues just do not mix. The marginalisation of the socialist challenge in Indian politics amply proves this. Erstwhile socialists have either mutated to practising mainstream politics of the Congress or the Bharatiya Janata Party variety or been relegated to the political fringe populated today mostly by environmentalist mass movements. Mamaji consistently refused to be drawn into national politics. He reluctantly accepted the presidentship of the All India Socialist Party in 1962 for a year after being pressurised by Lohia. Again after the 19-month incarceration in the emergency period, he was pressurised by Jayaprakash Narayan into becoming a member of the Rajya Sabha in 1978. He used to term the proceedings of the Rajya Sabha a farce. Yet inexplicably, despite his commitment to grass roots organisation and his scepticism about the effectiveness of the legislatures and parliament in bringing about radical change, he used to throw himself with vigour into election campaigns for candidates, who he must have known were going to lose, even when he was well past the age of eighty.

He was particularly peeved that the right to work had not been made a fundamental right in the Constitution. He once related to me in hilarious detail how he had tried his level best during his six years in parliament to try and get this done and how members of his own party had not responded. Just after this the 1989 elections for the Lok Sabha were announced and in the course of canvassing for the Janata Dal candidate, he came to our central office in a remote village in Jhabua and began exhorting us to spare no effort whatsoever. I was tempted to remind him of his recent diatribes against parliamentarians but at the sight of his intense, sweat streaked and venerable visage, suddenly the two famous lines from the Bhagvad Gita exhorting one to work diligently without hankering for any reward flashed across my mind, electrifying me from head to toe. I just took a deep breath and kept respectfully quiet.

When I first came to Jhabua in 1985 I had many rosy dreams about how an independent homeland in which bhils could hold their heads high without any fear in their minds would soon materialise. After a decade and a half of participation in mass struggles, in the course of which the various mass organisations in the region have been put through the repressive treadmill by the state, I have become today a considerably more realistic person. At times it becomes extremely difficult to sustain one's idealism in an ambience of all round decay. News of Mamaji's death at this depressing juncture, initially only served to deepen the gloom. Later, however, I recalled his ever smiling face, his incessant jokes and his untiring campaigns right up to the time he was bedridden from about two years ago. Mamaji's lifelong struggles in solidarity with the oppressed and in the face of overwhelming odds, will forever remain an inspiration for those fighting for lost causes.

GUJARAT

Attacks on Christians

Looking Beyond Communalism

Somen Chakraborty

The attacks on Christians in Gujarat have targeted the tribals who were either ignored or taken for granted by the current development model. Through the Narmada dam agitation the tribals have rediscovered their identity and found a new strength. The communal attacks are the response of the business class to this challenge from the downtrodden.

ATTACKS on Christian communities and their institutions in Gujarat during the last few months have become a major concern for the secular polity of India. The prime minister visited the violence-ridden areas of the state and proposed a national debate on the issue of conversion. The objective of such attacks seems to be to minorities and to mould the multi-religious Gujarati society into a hindutva framework.

There are a few important things to notice in these attacks. Even though attacks on minorities are evident all through the state, they are sporadic, of low intensity and damages are minimal. Secondly, among Christian institutions, those situated in rural areas have become the main targets. There are for fewer incidents of atrocities on the Christian communities in urban areas. A recent study by Nishant Natya Manch and Organisation of Women Studies found that major targets of these attacks have been missionary schools in adivasi (tribal) areas. It may be pertinent to note the demographic position of the adivasi population in the state. According to 1991 Census, out of the total population of 4,13,09,582, the adivasis accounted for 61,61,775 and the scheduled castes 30,60,358. The five districts of south Gujarat, viz, Surat (12,25,080), Bharuch (7,03,956), Dang (1,35,386), Valsad (11,81,404) and Vadodara (8,21,697) together have more than 65 per cent of the total adivasi population and more than 80 per cent of them live in rural areas [Census 1991].

Let us examine some recent attacks in south Gujarat. On October 29 the hindutva forces attacked the National Christian Conference at Vadodara. Police failed to act. Similar incidents of attacks are reported from Vyara of Vadodara district, Zanckov and Navsary of Surat district, a number of places in Dang district, Dharampur of Valsad district and also from Ahmedabad district in central Gujarat. Incidentally, except in the last few months, the attacks by hindutva forces are not directed against any specific minority community. Rather, this vandalism has been directed against the minorities of the state in general. At Bardoli, 35 km from Surat, tension mounted because of marriage between a Muslim boy and a Jain girl. In Radhikapur and Sanjeli, Muslims were attacked because one of their boys fell in love with and got married to a Hindu girl.[1]

The adivasis among the Christians have suffered the most. The majority of the victims among the Muslims are unorganised casual labourers, either self-employed or working in small manufacturing units. The Christians have been attacked on the pretext of alleged conversion of adivasis. The vandalism on Muslims are justified on two grounds – marriage of Hindu girls to Muslim boys, and selling of Hindu women to Arab countries. Ironically, poor people among minorities are the worst sufferers.

These incidents of violence have more than one dimension. Why are the attacks taking place mostly in the rural areas? Why are the adivasi communities the primary targets of attacks? And, why do they concentrate primarily in the districts of south Gujarat? An analysis of various factors would show that this communal frenzy is deeply linked with the economic crisis of the state on the one hand and the emphatic challenge by the adivasi communities to the present growth model of Gujarat on the other.

Lopsided Development

An assessment of the economy of Gujarat reveals that it has grown faster than the national economy since independence with an average annual compound growth rate of SDP of 3.32 per cent in the 1960s and 4.69 per cent in the 1970s. This growth rate was equally felt in the industrial and agricultural sectors. The number of factories increased by around 234 per cent between 1961-88. These factories are concentrated in central and north Gujarat which have railway connections with other cities [Hirway 1995]. South Gujarat was proud of its textiles industries since the days of the British. While these industries continue flourish in Gujarat after independence, there has been a continuous decline of productivity. Especially, after nationalisation, profitability of the textile sector has suffered given the growth of powerlooms.[2]

The annual growth rate of agriculture in 1960s was 2.27 per cent and in 1970s it was 4.22 per cent. The major factor for agricutural growth in 1960s was extension of cultivated land. In 1970s agricultural growth rate continued to be higher due to introduction of new fertilisers. There has been a major expansion of urban settlements. There was less than 100 towns/cities in the state (estimated on the basis of the present jurisdiction of Gujarat) at the time of independence and by 1990 the total number of towns/cities has increased to 260 along with a high urban population in the state compared to the all-India level [Bhatt 1997].

The benefits of this growth have not reached the poorest of society. Rather, it has caused large-scale pauperisation, especially of the SC and ST population. Economic growth has eaten into the natural resources which are a major source of livelihood for the tribal. Large patches of forest and fertile agricultural land in river basins have been destroyed. Expansion of urban areas has converted their agricultural land to residential plots and commercial centres. The water bodies have been used indiscriminately without considering the future sustenance of society. Since the early 1980s, the adversaries of this growth design became prominent in every sector of economy of Gujarat and by the end of the decade the overall growth rate came down from 4.69 to 4.37. Due to limited irrigational facilities and lack of necessary means to check the colossal wastage of rain water, the state experienced recurring droughts.[3] Agricultural yields declined so that by the end of the 1980s the state had a negative growth rate of -3.9 per cent [Hirway ibid]

The organised industrial sector performance was similarly dismal. The employment opportunities increased by only 81 per cent from 1961-88 which was far below the overall growth of the factories during the same period. Indiscriminate mechanisation has led to lower absorption of manpower resources in the state. Whatever employment opportunities did

come up, went to people from central, south and north Gujarat. The huge contingent of labour force, whether unskilled or skilled, whether insiders or outsiders, had small and tiny manufacturing units as the last resort for employment. A large number of this unorganised labour force are Muslims, who have migrated from far-off rural hinterlands of India. Under such pressure this sector soon had a large excess supply of labour causing an unprecedented increase in the casualisation of labour in the state. In the process a small business class, represented by the caste Hindus, emerged to dominate every sphere of life – economic, political and social.

Rapid industrial and agricultural growth, however, have neither enabled the people to become self-reliant nor have they been of any help to achieve development in its true meaning. According to the 1991 Census about 68 per cent of the SC population and 92.68 per cent of the ST population of the state still live in rural areas. The ST population resides mainly in the eastern hilly belt, while the SC population is spread over all the districts with some concentration in Saurashtra and north Gujarat. Incidence of landlessness in Gujarat is one of the highest (71.5 per cent in 1983) in India. The land is concentrated primarily in the hands of a few big landlords and the average size of landholding is more than 3.5 hectares [Fisher 1997].

Incidence of poverty is much higher among the SCs and STs. More than 60 per cent of the adivasi population, about 50 per cent of the SCs and less than 30 per cent of other communities are poor. The lack of concern of the government of Gujarat about these communities has been evident in its failure to improve the economy of the adivasi and other marginalised people in spite of various promises and commitments. Various poverty eradication programmes, meant for the SCs and STs, in fact, have benefited mainly the middlemen, bureaucrats and the politicians.

The recent communal frenzy has been mainly directed at these poor sections of the society. The purpose is to rip apart society into new economic, political and social identities. Therefore, the emergence of hindutva and the recent incidents of attacks on minorities need to be understood in the context of the overall socio-economic situation of the state.

The development process of such colonial design neither allowed the common people, nor the adivasi communities to participate in it, nor to improve their life system. Like the colonial masters, the politicians and the development planners of Gujarat have treated adivasi communities as cheap labour force and their habitation as a potential source of natural resources. Since the colonial days the forest resources in the eastern part of Gujarat, starting from extreme north to the Satpura mountains had been plundered indiscriminately. As the forests were decimated in the north-east of Gujarat, its inhabitants migrated to the south in search of forest land for agriculture. The adivasi population was pushed further into the hilly terrains of southern districts of Gujarat. They had one asset in this inaccessible mountainous regions – the river Narmada, a 1,312 km long river with unending flow of water. The river guarantees the tribals' right to life.

Exploitation of forest resources was not the only attempt of the Indian masters to destroy the adivasi polity. They were faced an identity crisis after the parliament evolved State Reorganisation Policy (1956). This policy not only shattered their self-sufficient life system. it split up their ancestral places into new states like Madhya Pradesh, Gujarat, etc, and thus the policy of reorganisation of states divided them into various artificial lingua-cultural identities. In fact, adivasi communities living in hilly terrains of the mountainous areas in the south-eastern Gujarat on the Satpura range have never accepted this new identity. These adivasis are not necessarily Christians. They are multicultural, multilingual and multi-religious society. There are bhils, bhillalas, chaudhri, kunbi, gonds, baigas and others. There are Hindus, Christians, Muslims and a large number of them profess their distinct adivasi religion.

Unfortunately, in the process of nation-building, the adivasis have been reduced from a community to labour force. The adivasi life system has been facing challenges to survival due to rapid commercialisation of forest resources, penetration of the capitalist market economy and the bureaucratic stranglehold of the state.

Narmada Project

A politically and economically dominant group take up a new development project, the Narmada River Valley Project. The aim was to ensure power supply to the factories and water supply to the residential settlements and townships of the business class. The justification of the project is based on wanton manipulation of facts and figures. The politicians and business classes of India, in nexus with the MNCs, the TNCs and the international financial institutions, led the world to believe that incidence of drought and flood over a large area of the state was due to shortage of rainfall. They related unemployment problems to the low growth rate of factories and then low productivity in factories to inadequate power supply.

The facts are that the factories usurped all the river water without allowing any provision for their future sustenance. The wastes and effluents discharged by their factories polluted river waters, silted them, reduced their flow and water storage capacity, and invited drought and flood.[4] The truth that the planners had never worked out a project to preserve run-off rain water was never disclosed. They never admitted that water shortage was the result of massive destruction of natural resources. Instead, they spread a myth of water-crisis and made the world believe that Narmada has excess water. They worked out the biggest water harvesting project on Narmada. The adivasi communities and their needs never entered the calculations.

In fact, no region can be declared drought-affected unless annual rainfall is less than 40 cm. Except in Kutch, nowhere in Gujarat is rainfall ever less than 50-70 cm annually. About 60 per cent of the drought-prone areas of Gujarat are in the north-west which is proximate to the desert area. South of Gujarat sometimes even gets more than 80 cm rainfall annually caused by the extension of the south-west monsoon. The state, by any calculation, gets rainfall almost equivalent to the average rainfall in India [Fisher ibid; Patel 1994].

Ironically, the Narmada project has never had the capacity to solve the problems of water and electricity shortage in the state. The present irrigation potential of the state without Narmada is estimated to cover a maximum of 40 per cent of the cultivated area. The Narmada project on completion will being a maximum of another 10 per cent of the cultivated area under irrigation. Open canals will not be able to make water flow up to the desert area in the western Gujarat. Therefore, the Kutch area which suffers most from acute water crisis and drought, cannot benefit from the project. The Narmada River Valley Project is, therefore, aimed at serving the already rich big landlords and industries of south and north Gujarat.

This dominating class of the state of Gujarat was able to persuade the Indian state for the Narmada project and got the approval to construct the Sardar Sarovar Dam on the Satpura mountains purpotedly to solve the water crisis of the state. The adivasi communities of the area were not made aware of what was going to happen to their life and livelihood. The foundation

stone of the project was laid in 1960. It was approved by the Narmada Water Dispute Authority in 1979. Today the project has not been completed. Among the factors which have delayed this project are people's movements, bureaucratic indecisiveness and financial constraints.

The adivasi communities living in the area were initially unclear about the effect of the project on their lives. But steadily and resolutely they put up resistance against the project. They have rejected the rehabilitation and resettlement packages offered by the state. Ultimately, the resistance by the adivasi communities, through their own local and regional organisations made the completion of the project almost uncertain. This uncertainty and delay came as a blow to the business community of the state. New projects had to be shelved. Profits have stagnated. Their ongoing commercial activities have low growth rates due to diversion of money, inadequate power supply and the demands by the displaced [Parasuraman 1997].

Tribals and Politics

Through the anti-Narmada movement the adivasi communities have rediscovered the rich heritage of their tradition, the strength of their collective identity and community power. The process of self-identification has enabled them to draw a new adivasi map as against the state-imposed political boundaries. They further consolidated themselves as adivasis, irrespective of their creed, language, clan or religion. This new adivasi solidarity by itself, is a negation of the proselytisation of these communities by the missionaries of different religious faiths. They have refused to be alienated from their collective life, language and lifestyle. They have refused to move away from their ancestral habitation. New place of habitation means new psyche new behaviour, changed occupations and altogether a different culture. This can be achieved if their existing life system is destroyed. Instead, they strengthened themseleves through new collectivity, renewed consciousness and well-knit organisations.

This unprecedented unity among the downtrodden and the oppressed, and those who are exploited, has always been considered a threat to the oppressors. Through this unity the adivasi communities of south Gujarat have resisted the Indian state and national and foreign interests on the Narmada issue. The project is one more mechanism of exploitation. Anti-Narmada movement has become instrumental in helping people express their preference for a new way of nation-building. The business communities, both of national and foreign varieties in nexus with the Indian state have used the ideology of development to continue their oppression. They have denied these people their fundamental rights enshrined in the Constitution of India. The business class and their political system have never felt comfortable seeing this emerging people's power. Their attempts to neutralise people's power have led people to challenging the ideological domain of the state. In nexus with the MNCs and the TNCs the dominant classes have tried to frustrate people in their attempts to form an ideology of development outside the ambit of the state and the global economic power.

The elite tried to depoliticise the people. They did not succeed. They offered them bribes. The people refused. They tried to call them 'misguided' or 'naxalites' [Baviskar 1997]. The communities were not shaken up. They tried to harass, torture and scare the adivasi communities. The communities stood firm. They circulated lakhs of pamphlets in south Gujarat defaming the protesters and their leaders. The people ignored them. They offered money in exchange for land. The adivasis firm on their demand for an appropriate rehabilitation and resettlement package and land rights. State actions and repressions notwithstanding, the movement of the adivasi communities continued to gather strength and widen its membership base.[5] The adivasi society is rejecting the dictates of the so-called mainstream state. A shift of paradigm of decision-making has been evident in the adivasi-concentrated rural areas of the south Gujarat.

The anti-Narmada movements for the last one and a half decades have enlivened the adivasi society and rejuvenated their rich traditions of resistance to foreign invaders. The movement has enabled the adivasi communities to reinforce their local identities and to rediscover specific histories, languages and regional specifications. The movement has thus rattled the state of Gujarat as well as the Indian state. The elite have now brought out their most lethal weapon – religion. The business classes wanted religious unity between them and the adivasi communities whom they had earlier proselytised. They used the ideology of hindutva to divide the struggling subalterns. The attacks on adivasi communities are an indication of this nexus between the hindutva forces and the business classes.[6]

This is why the recent attacks have targeted the adivasi communities. The business classes and the Indian state want to protect their own economic interests at the cost of the deprivation of the right to life of the adivasi communities. Hence, the big landlords and the business classes have used the hindutva ideology and the bogey of 'conversion' as a countervailing mechanism to keep the secular polity of our society divided and silent. In the guise of hindutva ideology they intend to suppress people's challenges to the economic policies of the Indian state.

A communal reaction to these attacks will help the gameplan of these vested interests. Therefore, what seems to be essential is the solidarity and cohesion among the secular and the pluralist masses, irrespective of caste, creed, religion and language against these new forms of state terrorism. Democratic forces from different social and ethnic groups need to come together for the common good of the struggling adivasi communities in the Narmada basin. Attempt to communalise the adivasi communities and thus to weaken their struggle against the present capitalist growth model can be combated if such a unity can be established on a minimum common programme. In this battle, either the profit-making of business community will continue at the cost of Narmada water or the life system of the adivasi communities will be protected by stopping any diversion of water from this river.

Notes

1 'Gujarat (An Indian State) Minorities in the Storm of Communal Attacks – A Report from the Religious Cleansing Laboratory of Rashtriya Swayam Sewak Sangh (RSS)', jointly commissioned by Nishant Natya Manch and Organisation of Women's Study during August 23-30, 1998

2 4,628 in 1942 to around 60,000 at present in Surat alone (*The Hindu Survey of Environment*, 1995, Chennai, The Hindu Publications, p 97).

3 During the frequent drought years the available quantity of water was 20 MAF for the population of 40 million The potential per capita use of water per day comes to 450 gallons during a drought year This per capita potential water use is about twice the per capita use of water in Israel and more than the per capita use of water in India, China and the UK However, because the present water use is not equitable, during a drought year people in large areas of the state do not even get 25 gallons per persons per day [Fisher 1997 333-34]

The reason is not successive droughts, as politicians and the proponents of the Sardar Sarovar Project often claim, but the excessive groundwater withdrawal through the mechanised pumps by farmers who switched to water-intensive agriculture due to loans and credit provided by the government (ibid 335).

4 Among the rivers in Gujarat, Sabarmati has several tributaries like Hathmati, Vatrak, Meshwo, Mahi has Bhadar, Anas, Panam and Meshro, Tapi's tributaries are Purna, Machchu, Brahmani, Hirni, Kapila, Ojhat, the Kanul; Surekh in Saurashtra and Kutch and Dhadhar

and Kim in south Gujarat. But most of them depend on the rain and for the rest of the time they remain dry [Bhatt 1997:92].

5 In exposing the undemocratic nature of statist development, the Narmada movement is contributing to the democratisation process nationally and facilitating the creation of a network that transcends national boundaries. Yet, the creation of this countervailing power yield greater repression and manipulation of those involved in resistance [Fisher 1997:441]

6 "Two prayer halls of the Christians were attacked in Doswada village in the tribal belt of eastern Surat district late on Thursday (January 21, 1999) night. In a retaliatory move two holly pillars, worshipped by tribal Hindus were attacked in Dandakwan village". *The Times of India*, New Delhi, January 24, 1999

Patels of Central Gujarat in Greater London

Parvin J Patel
Mario Rutten

Two contradictory forces – a spirit of enterprise and a tradition-bound status-consciousness – led the patels of central Gujarat first to Africa and then to the UK. Today they are successful shopkeepers, businessmen and professionals in the UK. But they also worry about keeping their language, culture and links to India alive.

ALTHOUGH emigration from the Indian subcontinent to foreign lands is an age-old phenomenon, emigration to western countries of Europe and North America is relatively recent. Today about two million persons from south Asian origin reside in Europe, the US and Canada. More than half of them, i e, about 1.26 million live in the UK, out of which one million are Hindus. Geographically, the Indian immigrants in the UK are concentrated in the urban counties. The largest number, i e, about 36 per cent of the total Indian population is settled in Greater London. Among the Indians the Gujaratis and the Punjabis constitute the largest number. About 35 per cent of the Gujaratis must be patels, the rest belong to vania, lohana and other castes. Not surprisingly, therefore, patels and singhs are the best known Indian surnames in the UK.

Gujarat is one of the most prosperous states of India. Since it has a coast, it has a long tradition of overseas trade. Gujarati businessmen have been active in Africa since the 13th century. They have been reputed bankers and moneylenders, most of them being Muslims. From among the Hindus of Gujarat, the patels, also known as patidars, of central Gujarat or Charotar have emigrated in large numbers. Charotar, the major part of central Gujarat, the area which lies between the Mahi river to the south-east and Vatrak river to the north-west, is the heartland of Gujarat. It was also formerly known as Kheda district and only recently divided into Kheda and Anand districts. There may not be a single village from about one thousand villages of Charotar from which at least one patel family has not migrated. There are some villages from which more than half of the patel families have emigrated. These patels, a middle-ranking peasant community, are upwardly mobile and highly status-conscious. With about 15 to 20 per cent of the population, the patels form a substantial minority who have been able to acquire economic, social, and political dominance in the region and the state since the early 20th century. During the British regime in India the patels of Charotar were highly respected for their industrious nature and sense of loyalty.

The emigration of patels began in the late 19th and the early 20th century, first to east Africa and then to the rest of the world. In east Africa, initially most of them took up jobs in railways and other civil services. There were so many patel employees in the east African railways, that it was also known as patel railways. Some of the patels, however, also started doing business there.

There is an element of truth in the argument made by some scholars like David Pocock that factors like famine and plague forced some members of this agricultural community to go to the east Africa in search of a livelihood. However, the role played by other social factors in pushing them out of their homeland cannot be ignored. In this connection some important social customs of this proud and upwardly mobile community need to be mentioned. One is the custom of inheritance. By this custom the property, mainly agricultural land, of a patel is equally divided among all his sons. As a result, the land, which was quite fertile, was increasingly divided from one generation to another generation to such an extent that at a particular point of time it became uneconomical for reasonable sustenance of many families. This naturally forced some such families to look for other alternative economic activities either within the country or outside. In addition, other social customs related to marriage, namely caste-endogamy, village-exogamy, hypergamy, and dowry also gave an impetus to emigration. Caste-endogamy implied marriage within the caste. Village-exogamy implied marriage outside the village. Hypergamy means a girl of a patel family must marry either into an equal status family or preferably a higher status family. In other words, a boy can marry a girl of the lower status patel family, but marriage of a girl with a lower status patel family is forbidden by custom.

Further, all patel families living within a village and all villages of the area are not socially equal. Therefore, most of the villages of the region are organised into marriage circles or 'gols' like: six villages ('chha gaam'), five villages ('paanch gaam'), 27 villages ('sattavis gaam'), 22 villages ('bavis gaam') and so forth. All these marriage circles are hierarchically organised in terms of their social status which largely depends on the size of the village, fertility of the land, and relative wealth of the village. For example, the six villages (chha gaam: Bhadran, Dharmaj, Karamsad, Nadiad, Sojitra and Vaso) are commonly accepted as big villages ('mota gaam'). They are not only large in size but also relatively wealthy and urbanised and,

therefore, commonly accepted as highest status villages. The patels of these villages are relatively more educated and sophisticated. Marriages generally are allowed within the circle. However, due to hypergamy a boy of six villages can marry a girl from any village but a girl of six villages must marry within the six villages. This also means that a girl of lower status village circle can marry a boy of a higher status marriage circle, which implies upward social mobility of the girl's family, but not the downward social mobility of the boy's family. This custom generated a competition in this highly status-conscious community to get their daughters married into the higher status families/ village circles and encouraged a related custom of dowry.

The dowry, which was originally a custom to give the share of a patel's property indirectly to his daughter (since by the custom of inheritance only sons inherited their father's property), over a period got vulgarised due to the customs of hypergamy and consequent status-seeking competition among the parents of girls. However, an unintended consequence of dowry was that it encouraged the members of this proud community to earn more money and save as much as possible to display their status at the time of a daughter's or sister's marriage by spending lavishly not only in the form of dowry but also in other forms of conspicuous consumption such as marriage feasts and related fanfare accompanied by elaborate decoration and music.

However, due to famines and increasing division of land, agriculture, which was the main source of livelihood, had become unproductive and economically unviable for the sustenance of many families by the late 19th and the early 20th century. Therefore, some of them decided to migrate in search of greener pastures so that they can earn enough to see that their daughters and sisters marry with well-born boys. Coincidentally, around the same time plenty of economic opportunities were available in east Africa. As a result, many patels started going to east Africa. But, when these east African countries became independent and initiated the process of Africanisation they were again forced to leave these countries. Most of them chose to settle down in the UK though the climate was not suitable to them. Social customs forced them to search for better economic opportunities, which they did not see in their homeland. Therefore, today we find sizeable number of patels in the UK. Thus, the social customs played a more important role than the economic factors in pushing them out of their country which explain their social life in the UK today.

Most of the patels, settled in the UK in the 1960s and the 1970s, are twice-migrants. First they went to the east African countries and then they migrated to the UK. They came in the UK in two major waves: (i) in the mid-1960s from Kenya, and (ii) in the early 1970s from Uganda. There is a slight difference between those who came to the UK from Kenya and those who came from Uganda. One of the reasons for this difference seems to be in the pattern of migration. It appears that due to higher education, greater urbanisation, and grater exposure to the outside world the patels of the big villages started emigrating earlier from the highest status six villages. For example, in the village directory of Karamsad, one of the six villages, it is stated that the first patel to arrive in east Africa was Maganbhai Patel of Karamsad. He reached Kenya in 1896 facing many odds. He also encouraged and helped many of his kinsmen to emigrate and settle down in Kenya. Fear of losing status by their inability to marry their daughters and sisters in the equal status or higher status families within their own marriage circle of six villages may also have compelled them to look for better opportunities earlier.

Most of the patels who emigrated early went from these six villages and settled down comfortably in Kenya, since Mombassa was the first port to land. Later they started encouraging their relatives who were interested in migrating to join them. Now, due to hypergamy some of their relatives, particularly the in-laws (marriage/affinal relatives), were also from other marriage circles. Therefore, slowly patels from small villages also started emigrating. Later as they found opportunities in Uganda gradually they started moving to Uganda also. Thus, it seems, the majority of patels who settled down in Kenya were from big villages and among those who settled down in Uganda the proportion of the patels from relatively smaller villages is higher. This reflects a relatively invisible but nevertheless significant status difference within the caste, as the patels of big villages are of higher status than those of small villages. Therefore, most of those who came from Kenya to the UK were relatively better-off and higher status patels than many of those who came from Uganda. Moreover, the patels of big villages who had migrated earlier to Kenya also had a stronger tradition of retaining linkages back home than those who came later and settled in Uganda due to various socio-historical reasons. This different tradition of maintaining linkages back home in India seems to be reflected in these two groups even in the UK.

Another reason for the difference between those who came from Kenya and those who came from Uganda to the UK is in the manner in which they came. Those patels who came from Kenya could plan their migration as they could anticipate well in time the consequences of Africanisation. Therefore, they could also transfer their wealth to the UK relatively easily. On the other hand, most of those who came from Uganda were expelled and, therefore, came as political refugees. What was, however, more shocking to many of them than the sudden and unexpected expulsion from Uganda by Idi Amin was the lukewarm response to them by the Indian government. In those days the Indian government did not realise the importance of the so-called non-resident Indians (NRIs). Therefore, many of those who have settled down in the UK, after being expelled from Uganda, ironically interpret the term 'NRI', much trumpeted by the Indian government of late, as 'non-required Indians', and their bitterness is also reflected in their lack of enthusiasm in maintaining linkages back home in the form of investments in India.

However, whether they have come from Kenya or Uganda, the patels have carved out their niche in the UK. They are respected for their hard work, honesty, loyalty, enterprising nature, and business acumen. They are also often envied for their extraordinary success in trade and other economic activities in a very short time, where they had to compete and survive not only with the white community but also with the other business communities of India such as vanias, lohanas, ismailis, and Sikhs, among others.

According to a study by Michael Lyon and Bernice West, about 90 per cent of the businessmen belonging to the patel community of London are involved in independent retail business, such as corner shops. Nearly 70 per cent of patel firms in London sell newspapers, confectionary and tobacco. About 20 per cent of patel shops sell drinks, grocery, etc. About 10 per cent patel businessmen are professionals like pharmacists, accountants, opticians, dentists, etc. The patel shops are spread all over London. Nearly 50 per cent of the patel firms in London are located at their place of residence, having the shop on the ground floor and the family living above it.

It is observed that in many cases both husband and wife run the shop in rotation. Some of them are not very fluent in English

language though their clients are mostly whites, blacks, and non-Gujaratis. However, they manage to communicate with their customers pleasantly with limited command over English language. When their children grow up they also start helping their parents, particularly the sons.

It seems that most of the first generation patel migrants, who could not get respectable jobs, for one reason or the other, turned to business like corner shops selling confectionary, tobacco, newspapers, grocery, etc, sometimes also a sub-post-office. However, the children of the first generation migrants who are born and/or brought up in the UK have started entering professional businesses.

One of the secrets of the success of patel shops was their willingness and ability to work hard from dawn to dusk. Their pleasant and cheerful manners added a personal touch to the business. Now, however, since the 80s the corner shops and post-offices have started losing business very fast. The corner shops are losing business due to the so-called super market revolution. Not only have the super markets come up in large numbers but they also remain open for longer hours. Besides, since they buy their goods in bulk, they can sell them at cheaper prices as compared to small shops. In addition, the advantage of the super markets is that they sell all necessary items required by an average customer at a single place. For all these reasons the super markets have gradually pushed the small shops in the background. As a result, many owners of these small shops have to work very hard to survive. The post-offices are also losing business because now they do not have monopoly over selling stamps, nor do they retain monopoly over disbursing the social security money. Moreover, the revolution in modern media of mass communication has marginalised the utility of post-offices. For all these changes the small shops of patels are not as economically viable as they were in the 60s and the early 70s. Yet, they have some advantage in ethnic business like saari shops or Indian spice shops which are likely to survive for quite some time due to personalised customer-oriented relations and also due to the Indians' desire to retain their ethnic identity. But in this business also they have to face competition from other Indian communities.

The patels, however, are known for their independent entrepreneurship, powerful family loyalties, pragmatic nature, achievement-orientation, and strong instinct of survival against any adverse situation. This gives them resilience against the changing circumstances. Not surprisingly, therefore, some of them, who think that there are better opportunities in the US, have started moving from the UK. However, due to better social security in the UK, as compared to the US, this kind of movement is very limited.

The most remarkable peculiarity of the patel community, however, is that though they are ever willing to adapt to the constantly changing external economic environment, they maintain strong internal integration with reference to their social life. Therefore, they have retained their identity by organising themselves in terms of their ancestral villages of origin and marriage circles. They have formed the associations based on their villages like Bhadran Bandhu Samaj, Karamsad Bhandu Samaj, etc. And some of them have also formed associations based on their marriage circles ('gols') such as Shree Sattavis Gam Patidar Samaj. The village life in India had a profound effect on the first generation migrants. Their formative years were spent in their villages, where they studied. Moreover, they grew up at a time when the national independence movement awakened the pride of ancient Indian culture and its heritage. Therefore, the social identity of the patels is deeply embedded in village life which was highly intimate, co-operative, intense, and amicable. The religious and cultural bonds further cemented those ties with village people which they remember with nostalgia. Therefore, for the first generation migrants the ties with their relatives, villages, and country have romantic value and hence are quite powerful. They consider themselves British citizens and yet they think they are the self-appointed ambassadors of India to the UK.

However, the same is not true with their children and grandchildren. They identify themselves relatively more with the British society and western culture. As a result, the biggest anxiety of the patels in the UK is how to reclaim the second and third generation. They encourage them to learn the Gujarati language. This problem, of course, is not only of patel community. The entire Gujarati community of the UK is now becoming conscious about teaching their children Gujarati. The children are mostly able to understand functional Gujarati. But they find it difficult to speak, read, and write the Gujarati language. Therefore, now the community has started making organised efforts to teach Gujarati. There are about 500 classes teaching Gujarati language all over the UK, teaching it two hours a week on Saturdays and Sundays. About 1,000 to 1,500 students appear in Gujarati language examinations each year. Secondly, to retain Indian culture and their religion the parents are also anxious to orient their children to the religion. They participate with family in all important religious activities.

However, the most important problem of the patel community in the UK is the marriage of their children. Village-based associations and organisations of village-circles are very important to them. Many of them bring out directories giving details of all family members which are mostly used to arrange marriages. These associations also organise marriage-melas, in which young boys and girls publicly introduce themselves and try to find suitable life-partners. This kind of arrangement, however, is too formal and awkward for the younger generation. Therefore, dinner-and-dance parties are becoming more popular. However, parents become anxious about such parties thinking that the children will take undue liberties. But, on the other hand parents are worried about becoming too conservative and strict with their children. Instances of inter-religious, inter-racial marriages are increasing. The problem, however, seems to be rooted in their concept of traditional Indian culture and Indian family life. They want their children to be loyal, obedient, and caring for their parents. The elders want to be respected and looked after by their children in their old age and, therefore, they want to inculcate traditional family values such as being loyal to one's parents and siblings, helping their relatives back home, loyalty to the village in general, and patel community in particular. Keeping these goals in mind the village associations and marriage circle associations organise several functions celebrating Navratri, Diwali and other important festivals. They also have dinner-and-dance parties, where they eat, drink, and dance to the tunes of Hindi songs. In some cases they have youth committees in which youngsters are involved and encouraged to organise and participate in various activities.

Thus, on the threshold of the 21st century the patel community of the UK seems to be at the cross-roads in every sphere of life. On one hand, it is becoming trans-national and extending its links in different countries of the world from India to the US. On the other hand, it is struggling to maintain its traditional culture by reclaiming the younger generation. It is difficult to predict the outcome. But considering at its enterprising nature and resilience, the community is likely to throw-up innovative adaptation strategies.

A Dissent on 'Fire'

C M Naim

Once the film 'Fire' was attacked, it became a liberal cause and defending artistic freedom and countering the hindutva forces claimed all the energies of progressive commentators. Most of the defenders of the film followed the lead of the protesters and pitted their own version of Hindu culture against that of their adversaries. Hardly any considered the issue as a human condition. It is now time to present a dissent on the film itself.

THE video copies of Deepa Mehta's 'Fire' available for rental in video stores in the US since January prominently announce on the back: 'Banned in India'. The fact is it was never banned. Except for Delhi and Mumbai, where its screenings stopped after two violent demonstrations, 'Fire' continued to be shown in several major towns in India, including Lucknow, the capital of Uttar Pradesh where the Bharatiya Janata Party has ruled since December 1997. I saw it there in a packed hall two weeks after the trouble in Delhi on December 4, 1998. In fact, it ran in Lucknow for many more weeks, four shows daily, with an average of 80 per cent attendance much of the time. But the American distributor knows what will sell the film locally, and so does his Indian counterpart. According to the *The Times of India* of February 24, 1999, the Indian distributor, J Sughand, carried out the changes 'suggested by Mr Thackeray', and the film was to be screened again 'from Friday onward'. (Unfortunately, the report did not indicate what changes were 'suggested' by the Shiv Sena leader.) Another report in *India Abroad* (March 19) indicates that the Censor Board, after reviewing the film, again did not ask for any cuts. Nothwithstanding all this, I have no doubt that the film's videotapes will soon be available for purchase at a discount here in the US, still proclaiming: 'Banned in India'.

Mehta's film was much written about in December and January, mainly with reference to the two protests against it in Delhi and Mumbai by people who described themselves as defenders of Hindu/Indian religion and morality, and who condemned the film for showing two Hindu women become lesbian lovers. The press identified the protesters, mostly women, mainly as members of Shiv Sena, a right-wing group politically allied with the ruling Bharatiya Janata Party but also engaged – at the time of the protests – in a tussle with it for power and bounty in Mumbai and Delhi. (Bajrang Dal, a sister organisation to BJP and the other group mentioned in the news in connection with the protests, likewise felt itself being marginalised by prime minister Atal Behari Vajpayee and his particular supporters within the Hindu nationalist political family generally referred to as the Sangh parivar.) Before the protests, there had been the usual reviews and notices, all, to my knowledge, laudatory. They particularly praised the film for presenting female homoerotic feelings on the Indian screen for the first time. None found anything wrong even in the manner those feelings had been packaged. Than the two protests three weeks later turned the film into a liberal cause. The dual projects of defending artistic freedom and countering the self-appointed protectors of Hindu family values and culture claimed all the energies of progressive commentators and activists in India and the diasporic Indian media in the US.

Now that some time has passed and the film is back on Indian screen – that is what counted then and also counts now – a dissent on the film itself, I hope, might not be unwelcome. My comments below are arranged under three headings: (1) the audience of the film and its reactions to it during the viewing I attended at Lucknow; (2) the film, and its alleged main concern, lesbianism; and (3) the protests against the film, and the reactions to the protests.

The Audience

As will become clear in my subsequent comments on the film itself, it is important to bring quite explicitly into any discussion of 'Fire' the Indian audiences of the film and their actual or possible reactions to it. I saw 'Fire' in December in Lucknow. It was in its sixth week of release in a large movie house in the best part of the city, with four daily shows. I went to the first show, at 1 pm. The cheapest ticket cost Rs 15, the most expensive Rs 40. Nevertheless, all sections of the hall were almost entirely full.

I sat in the balcony, the 'best' seats. There were quite a few women there, all seemingly accompanied by men. A few couples as they came in were loaded with bags and bundles of purchases. One couple in their thirties came in carrying suitcases, as if they had broken their journey just to see the film. No woman was dressed in jeans, though many men were. I could not be sure if there were as many women downstairs too. From where I sat I could see only the cheapest, front section below, and that seemed to be an all male crowd.

Once the movie started it soon became clear that there were many in the audience, particularly on the main floor, who had come a second time. As commonly happens in India, or at least in north Indian movie houses, the audience frequently anticipated the narrative by making loud comments and by noisily jeering or cheering some still unfolding scene. (These loud vocal responses were by no means restricted to the 'lower', i e, cheaper, sections.) As I jotted down soon after, the jeers were mainly aimed at the pastoral memory bits and two 'unmanly' husbands who could not 'control' and 'satisfy' their respective wives – more particularly at the older brother when he discovered the two women in bed but did not physically assault them, as the audience noisily urged him to do, or when he visited his swami mentor and massaged his leg, at which time some in the audience loudly expressed their desire to do unmentionable things to both men. The cheers, equally loud, came for the servant's masturbation scenes and the assault by the younger brother on his wife, and also when the two women separately denied intimacy to their respective husbands.

Clearly a great many men in the audience found much sexual excitement and voyeuristic pleasure in the film, which they expressed with exuberance. At the same time, I heard no comment, either during the screening or while coming out of the theatre, that could be called a denunciation of the film itself. It was clear that a good time was had by all, that everyone's expectations had been well met.

No doubt one should not draw too many inferences from what happened at one screening, but an awareness of what transpired at that occasion would help the reader understand my response to the film. Secondly, it is also important to put on record my impressions of that one audience because several defenders of the film made a point to report that, at Delhi showings, no catcalls and voyeuristic giggles, 'even from the frontbenchers', were to be heard. Obviously, the matter of audience response is of some signifi-

cance. To my mind, it directly relates to a number of critical issues. How can one be explicit in representing sexuality without the representation being seen as pornography? What is the social context in India of a film that tries to do that for lesbianism? Equally importantly, for my particular purpose here, what is the 'filmic' context of such a film there? How will such a film be 'read' by an audience accustomed by years of Bollywood Hindi films to having its expectations met in certain ways?

The Film

I must begin by stating that the film grabbed my interest from the beginning and held it all the way through, primarily due to the superb performances of Shabana Azmi and Kulbhushan Kharbanda. Azmi, with her amazingly expressive eyes, again uses silences to delineate more subtleties of feelings than any dialogue ever can – I kept thinking of her role in 'Ankur' Kharbanda, whose task is the more difficult because he must work against the sympathies of the audience, is equally riveting as he communicates through speech and body language a tragically faulted but complex personality. The younger actors in the ensemble also hold their own in such demanding company. Deepa Mehta, the director, must be congratulated for getting these performances.

The film's story deals with a middle class Hindu family in Delhi, living perhaps in Karol Bagh or Lajpat Nagar. The family consists of two brothers, their mother, their wives, and one male servant. The brothers own a fast food place, above which they live. The younger brother also runs a video rental business on the side. In other words, the folks have both property and money, but they are not the 'modern' kind who would have moved to a fancier housing colony. Their lives revolve around the business – though the men do have outside interests, the wives work in the food store, as does the servant/cook, and do not venture away from home on their own.

All is not well, however. The older brother, Ashok (Kharbanda), has been married to Radha (Azmi) for several years, but they do not have a child because Radha has 'no eggs in her ovary'. As a result, Ashok has submerged himself entirely in a kind of personal-devotional religion. He is being 'good' in his own way – he has not sent Radha back to her parents, nor has he taken another wife, but the couple no longer have sex. The brothers' mother lives with them, but she is an invalid – though alert to the world around her, she can neither move nor talk. The servant, who lives with the family and who is not allowed any time away from it, is often asked to take care of the mother by himself, at which times he watches pornographic videos – the younger brother keeps them in his collection to rent to school boys – and even masturbates in the mother's full view. As the film opens, the younger brother, Jatin (Jaaved Jaffrey), who is infatuated with a Chinese-Indian girl, has just married Sita (Nandita Das) – she is named Neeta only in the Hindi version – but he utterly neglects his lovely wife on their honeymoon in Agra. Their marriage is consummated – it is more like rape – only later in Delhi. Thus, what appears as a 'respectable' and 'normal' middle class family is in fact seething with sexual frustration.

The focus on Sita continues in the second sequence, when the honeymooners return to the family home in Delhi. After the men leave, Sita goes into her and Jatin's bedroom. There she puts on Jatin's jeans and dances wildly to western music until Radha knocks on the door and gently rebukes her. Thus by the end of this sequence we have rather forcibly been told that Sita speaks English, can wear jeans and dance to rock music, and knows about sex though still a virgin.

Here it may be important to remember that Mehta, a resident of Canada, originally made the film in English, and only subsequently dubbed it into Hindi. There is a certain problem inherent in such a process. When the language of a film set in India in English, watching the various characters interact solely in English requires from the audience, a suspension of certain expectations of 'realism'. In which case, the odd Hindi word or phrase thrown into the English acts only to create a semblance of linguistic realism, *without any reference to social categories*. In other words, the Hindi mixing with English enhances realism in terms of the Indianness of its characters, and not in terms of their class origins, education, or cultural orientation and values. On the other hand, given the status and prevalence of English in India, a radically different effect is produced when English words, phrases, or short sentences are thrown in with realistic Hindi dialogue. Now the English tidbits indicate status, 'modernity' and 'westernness' – another well known convention in Hindi films. Consequently, the ease with which Sita uses English only adds to her being perceived by an Indian audience as a 'modern' girl.

This impression is enhanced by what happens in the most explicitly sexual scene in the film, the very first physical contact between the two women. Radha comes to a distraught Sita, and tries to be consoling by assuring Sita that things would soon work out between her and Jatin. Sita replies, 'No, it's not that'. Then she leans forward and kisses Radha full on the lips. What are we to conclude? Evidently Sita has already been attracted to Radha. She understands her own homoerotic feelings and is not surprised by them. In other words, she knows about lesbian love. That, in the English version of the film, would imply to its audience in the west that she was married against her wishes, in fact against her sexual orientation, while to the audience of the Hindi version she would only appear more negatively 'modern' – she knows about 'these things' too. These twin images of her are further confirmed when she alone repeatedly initiates physical contact, eventually bringing about the final crisis. In another scene, Sita puts on western male clothing to dance with Radha, which not only affirms this perspective but also underscores her 'manly' role in the relationship as perceived by the writer-director.

Thus in terms of the established markers in Hindi cinema, Sita is no innocent soul; she, in fact, is a 'modern' or 'westernised' girl, who, according to the convention, can be at best a misguided person and at worst an evil vamp. Further, in terms of the rules of expectations in popular Hindi films, she comes into a 'decent' family and, true to her screen image, destroys its precariously held balance once her own sexuality is denied by her husband.

To my mind, therefore, the Hindi film 'Fire' – the Hindi version retains the English title – projects two, and only two, conclusions about lesbianism:

One, female homoeroticism is 'caused' by a denial of women's natural heterosexual desires, i e, a sexually denied heterosexual female becomes a lesbian. That was also the curious message in the Urdu story, 'The Quilt', by Ismat Chughtai, which has been much translated and uncritically anthologised as perhaps the first modern Indian story on this subject, and which was quite ignorantly mentioned by at least one mewsmagazine writer as the film's source (*Outlook*, December 14, 1998). Two, lesbian love is a 'western' thing – girls who speak English, wear jeans and dance to rock music are more likely to be so inclined than a girl who is 'truly Indian'.

In other words, on the issue of causality, the film simply reinforces the general belief that homosexuality is not natural, that it has social, not biological, causes, and that given proper education and environment, it can be 'cured' by any worthy member of the opposite sex. The latter was exactly the sentiment expressed by several members of the audience in Lucknow when the two wives refused to have sex with their husbands; the hecklers denounced the husbands as 'weaklings', and loudly proclaimed their own sexual prowess and physical endowment. This, of course, is one of the favourite themes in pornographic writings in Hindi, where often a 'well-endowed' heterosexual hero 'cures' coeds and neighbourhood girls of this

'unnatural' habit. It has a long history too. In Urdu, Sa'adat Yar Khan Rangin had his hero do the same in a late 18th century poem.

My second problem with this film is in regard to its reinforcement of some of the prevailing and not so pleasant concepts of 'manliness' and 'Indianness'.

Jatin neglects his dusky Indian wife because he is infatuated with a fair-skinned Chinese girl, who has no desire to marry him – she hates joint families, and she wants to work in Hong Kong films. She also has a brother who hates India. In a scene in a Chinese restaurant, the brother makes several denigrating statements about India and Indians. Jatin listens silently and does nothing. To an Indian audience, he thus proves himself once again to be 'impotent' or 'unmanly'. (His refusal/inability to make love to Sita on their honeymoon; the eventual, quite embarrassing consummation of their marriage; his failure to control the Chinese girl – these are the other several 'unmanly' things that Jatin does.) The 'westernised' Chinese girl, who practices 'free love', thus becomes a second negative female in the film, reinforcing all the existing prejudices. One fails to understand why Deepa Mehta chose to introduce these Chinese-Indians in her film. Was she unable to conceive of a 'regular' Indian girl having an affair with another Indian? Bear in mind that strong anti-Chinese sentiments have existed in India since 1962, when Indian army lost to the Chinese in the Himalayas and much harm was done to the local Chinese in Calcutta and elsewhere.

And what is one to make of the servant? His life is very lonely and very hard. He works in the shop and in the house, just like the two wives. And like them, he too does not get any chance to get out into the larger world. In fact, he is more housebound than the wives; he must take care of the invalid mother when they go on shopping trips and such. So he passes time watching sexy videos and masturbating in Maji's presence. Is he just another despicable male, or is he an exploited human being? Or is there a parallel suggested here between him and the two women: they are all exploited and rendered sexually frustrated by the two brothers.

Perhaps the idea is to suggest a profounder parallelism, that between class-based and gender-based oppressions, and the sadly frequent inability of the victims of the one to stand in solidarity with the victims of the other. Perhaps. Such easy profundity is also attempted at (1) by bringing in several disparate cultural 'texts' in the form of 'Ram lila', 'katha' and 'qawwali', which are supposed to be metaphoric adjuncts to the film's main narrative in an attempt to raise it beyond the story of two contemporary women; (2) by naming the two wives Sita and Radha, and by linking the elder brother's religiosity with his denial of Radha's sexual feelings – he starts on his devotional path when he learns that Radha cannot bear him a child; (3) by naming the film 'Fire' and making repeated references to the ordeal-by-fire that the Sita of *Ramayana* had to undergo due to the societal concerns of her divine husband, Rama; and (4) by situating the union of the two women at the end of the film at a brightly lit but empty shrine of the great 13th-14th century sufi saint, Hazrat Nizamuddin Auliya.

The last, I must confess, refused to reveal its purpose to me until I read Shohini Ghosh's 'From the Frying Pan to the Fire' in *Communalism Combat* of January 1999. Ghosh teaches video and television production at the distinguished Mass Communications Research Centre, Jamia Millia Islamia, New Delhi, and her article originally appeared in the *Journal of the Indian Institute of Advanced Studies*, Simla. According to her: "Radha and Sita are reunited at the shrine of Hazrat Nizamuddin famed for his intense and homoerotic bond with the legendary poet Amir Khusro. The film ends with the women in embrace within this symbolic space." (And here I had thought that the Chishti saint was actually famous for his piety, and that people, Muslim and non-Muslim alike, went to his shrine in the hope that he would work a miracle for them.)

This last 'profundity', however, is the more egregious; it not only terribly distorts Sufism, it sets up a totally false and possibly dangerous dichotomy between Hinduism and Sufism/Islam. The former becomes all cold, unfeeling and hypocritical; the latter all warm and caring. Perhaps, as another Shohini Ghosh might declare, Deepa Mehta meant the initial visit to the Muslim sufi shrine and the final meeting in it to be a secular 'intervention', an anti-communal gesture. In that case, I'm afraid, Mehta seems to have ended up merely communalising her own otherwise valid critique of Indian masculinity – and for nothing. As everyone knows, Islamic patriarchy is no less oppressive of women than the Hindu version. Mehta's need to find an alternative 'symbolic space' for the two lovers could have been more properly served if she had looked into some of the 'bhakti' and other devotional traditions available within the umbrella of Hinduism.

The Protests

When the film was presented to the Censor Board of India, they made only one suggestion: change the name of the younger woman in the Hindi version, from Sita to Neeta. That the English version, however, was allowed to be shown in India without any alteration is clear from the review by Nikhat Kazmi which appeared in the *The Times of India* of November 15, 1998, in which she repeatedly referred to the character played by Nandita Das as 'Sita'. The two attacks by the Shiv Sena men and women occurred on December 4, three weeks later. The screenings in Delhi and Mumbai immediately stopped, but continued elsewhere – even when the film was sent back to the Censor Board for a second look. The movie, no doubt, was released in a limited manner, as is the case with off-beat movies in India, but more extensively than had been the case, say, with the movies of the New Indian Cinema earlier. It was simultaneously released in many major cities all over India and was screened four times each day of week – those earlier 'new' movies were mostly shown once a day, in special morning screenings, and hardly ever in several cities at the same time.

The charge against the film came down to two counts: (1) its alleged promotion of lesbian love, and (2) its alleged attack on Hindu faith by naming the two women Sita and Radha. Bal Thackeray, the Shiv Sena supremo, while denying that he instigated the demonstrations, thundered: 'Lesbianism is not Indian'. He then asked: why were the women named Radha and Sita, and not Saira and Shabana? (The reference being to Shabana Azmi and to Saira Bano, the actress wife of Dilip Kumar (Yusuf Khan) – Kumar had demanded judicial action against the violent protesters – both belonging to the Muslim community.) To my best understanding, the Shiv Sena-led attacks in Mumbai and in Delhi, where they were supported by Bajrang Dal, were primarily political moves – a way to flex their muscles – aimed against the BJP, with which both were having problems at the time. It was their way to appear 'holier' than the BJP and be openly threatening at the same time.

Most of the defenders of the film, however, followed the lead set by the protesters and pitted their own version of Hindu culture against Shiv Sena's and Bajrang Dal's. According to the defenders, lesbian love was as 'Indian' as Kama Sutra, Khajuraho, and Sanskrit court poetry. Hardly any considered the issue in terms of the human condition, that homosexuals, male and female, could be as helpless and normal in their desire and orientation as any so-called 'normal' heterosexual. Perhaps that is why at least one lesbian activist group in Delhi called 'Ekangi' is reported to have stayed away from taking a public position on the film.

[I wish to thank Kamala Visweswaran and Sheldon Pollock for their helpful comments.]

Tribals and Dryland Development

M V Nadkarni

India's Drylands: Tribal Societies and Development through Environmental Regeneration by Mihir Shah, Debashis Banerji, P S Vijayshankar and Pramathesh Ambasta; Oxford University Press, Delhi, 1998; pp xi + 322, Rs 525.

THIS is an ambitious book, which tries to bring together and integrate the following points (not necessarily chapterwise):
(i) India's drylands which constitute a major part of the country, face the twin problems of environmental degradation and poverty. Green revolution has not solved these problems and has in fact aggravated the crisis on account of over-exploitation of groundwater.
(ii) The tribals living in these drylands are the worst hit by ecological degradation and by the failure to integrate them into economic and social mainstream of the country.
(iii) Theory as well as policies based on neoclassical economics and market-oriented strategies cannot solve these problems.
(iv) 'What market forces, cannot do, what the private sector will not do, the state must'. The book argues in favour of a 'massive state intervention, albeit in a completely redefined form and context' to solve the problems of unemployment and poverty.
(v) The ad hoc or piecemeal programmes of employment generation cannot achieve much. On the other hand, a programme of environmental rehabilitation of drylands and 'a biomass-optimising growth strategy based on total watershed plannings (TWPs)' is more suitable. 'TWP recovers the crucial link between economy and environment'.

Thus, the focus is on the inter-connected problems of drylands regeneration, uplift of the tribals, and solving the problems of unemployment and poverty, through an ecologically sound growth strategy. The arguments are made in a forceful and refreshing manner, and are intended not only for cold academic analysis but also mainly for policy formulation. In the process, a lot of useful information is also presented.

The author's special concern is with the tribals of drylands. A little over half of India's tribal population live in dry regions, including hills and dry forests. It is noteworthy that the authors have lived with the tribals, participating in their development and know their problems first hand. They have observed how the irrigation-intensive strategy of green revolution has bypassed the dryland tribals almost completely. It led to neglect of the problem of soil erosion and of dryland development. The authors describe a 'menu of technologies' which can take care of these problems. These technologies are of two types: one addressed to soil and water conservation, water harvesting, erosion control and soil enrichment; and the other addressed to dryland cropping system – involving both annual arable crops and perennial fermenial crops including agro-forestry. The authors argue that these technologies provide a key to dryland development, employment generation and removal of poverty in dry regions.

Though the authors have advocated state intervention, they emphasise that dryland development through the above technologies can be achieved only through people's institutions. They observe that unfortunately the pre-existing power structures of rural India have stymied the initiative of the panchayat raj institutions (PRIs). These institutions, according to them, need both (a) 'a powerful grass roots initiative towards a pro-poor alliance, deeply sensitive to the women's question'; and (b) 'a strong thrust towards technical capability enhancement...' The authors believe the NGOs can play a useful role in providing both these inputs (pp 292-93).

The book is a very useful contribution to understanding the problems of dryland areas. However, it has a few limitations. Though the study makes a strong case for state intervention, it does not clarify how, in what form and who what extent it has to be provided. This is particularly important because the authors also discuss the limitations of PRIs and emphasise the role of NGOs. Moreover, what about the limitations of NGOs themselves and the problem of making them accountable?

Secondly, the problem of poverty and unemployment in dryland areas is sought to be solved within the framework of agriculture alone, including agro-forestry. Admittedly, agriculture will have a major role in this. Afterall, it is important to make dryland agriculture absorb more manpower and also make it less vulnerable to droughts. But drylands also need diversification of their economy and reduction in the pressure of population on agriculture and agro-forestry for livelihood. Diversification can make their economy less vulnerable to uncertainties of weather, by providing alternative sources of employment. Dryland villages and regions which have succeeded in developing rural industry and the service sector including education and health, have been able to reduce their poverty levels much better than other regions which continue to depend on agriculture alone. It should be conceded, however, that tribals will benefit mainly from sustainable development of dryland agriculture and agro-forestry. But by dissuading non-tribals from competing with tribals in agriculture and forest sector, this sector can be increasingly reserved for tribals, and employment opportunities outside agriculture be increased both for tribals and non-tribals.

The book is written at a general and impersonal level. It does not refer to personal experiences of the authors about the tribals with whom they had lived and the problems they faced and solved. There are no case studies or illustrations to bring out the point why the technologies and strategies advocated by the authors are better suited than other strategies.

In spite of these limitations, the book makes a rewarding reading.

Waves in Fashion: Macro-Economics and Development

Ashima Goyal

Macro-Economic Challenges and Development Issues (Essays to Commemorate the Birth Centenary of C N Vakil) edited by Dilip M Nachane and M J Manohar Rao; Himalaya Publishing House, Mumbai, 1997; pp 457, Rs 750.

THIS volume is a tribute to C N Vakil in more ways than one. Apart from being motivated by his centenary celebrations, it demonstrates the ways in which his vision and interests have influenced the development of the 'Bombay School', and continue to direct current research interests in the department of economics in Mumbai University. The explosion of work in the department on macro-economics, finance and political economy has deep-roots. As the editors emphasise, Vakil was a natural liberaliser whose ideas were neglected until such ideas became internationally fashionable. But the aspects of his ideas that were rooted in Indian structure, such as the theory of wage goods, are still not fully appreciated. As the heavy cost of the first neglect is realised, perhaps the second will also be remedied.

C N Vakil also feared the effects of unrestrained monetary expansion, and worried about the tendency of governments to overspend. While the second may have been a feature of the 1980s, the first has never happened in India. Vakil's own ideas about the relation between monetary expansion and inflation were subtle. Only monetary expansion in excess of the supply of wage goods was certain to cause inflation. But he thought that, such an outcome was very likely in India in the context of planning. The Bombay school has followed him in worrying about the link between the government's fiscal deficit, money supply and inflation. But it has been neglecting that rider – the supply of wage goods. Meghnad Desai poses the question provocatively in his C N Vakil Memorial Lecture titled, 'Why Is India a Low Inflation Country?' Indian inflation is minuscule compared to Latin America's, and in spite of a consensus on political economy that sees the Indian government as accommodating interest groups at the expense of the fiscal deficit. Desai says that the answer lies in the large stocks of foodgrains available after the green revolution. These prevented the rising fiscal deficit from translating into inflation since food price inflation was moderated. Desai ends by worrying about achieving low global norms of inflation in the context of mobile global capital. There is a wage goods argument for an open economy [Goyal 1998]. The elements of this are: adjusting the nominal exchange rate to equate domestic to international prices of food at average Indian purchasing power or wage rates; liberalising agriculture gradually (along with policies to raise its productivity); and using monetary policy to equate real domestic to international interest rates to create conditions for high growth stable real exchange rates and optimal transition to fiscal health.

The paper by Desai kicks off the first section on political economy. In an empirical study of the links between interest groups, government size and growth, Ajit Karnik and Mala Lalvani find that although activities of interest groups are positively associated with larger government expenditures, the extent of misallocation of resources is not large enough to lower rates of growth. Political economy can be analysed from many different aspects. Abhay Pethe tries to initiate a dialectic exchange between Marxian political economy and mainstream economics. But although Marxian ideas of class conflict may not have had much impact on mainstream economics, they have certainly influenced labour laws, institutions and conflict in India. In the face of global competition, it is more important to go back to an older tradition of co-operation; labour leaders today recognise that. The enemy now is not the capitalist as much as the competitor. Even in Kerala the number of strikes have fallen from 37 in 1992 to 25 in 1997.

The next section turns to planning. L M Bhole decries both the state and market based systems and makes a passionate plea for a more humane via media. D M Nachane argues that wherever there are problems of co-ordination and feedback between multiple levels, hierarchical control systems theory is a powerful tool. He demonstrates its application to the Arrow-Hurwicz model of decentralisatio. and to a simple macro-economic stabilisation model. K N Prasad et al in a manpower-planning model discover mismatches between availability and requirement of critical skills. They warn that this is dangerous when modern development is information and knowledge intensive.

Planning is the flavour of yesterday, regulation the flavour of today. Part four takes this up. Regulation must be more severe if excessive profits are due to restrictive practices; it can be more lenient if economies of scale stimulate profits and growth. Sandesara in a business-like review of theories and evidence suggests that the prevalent first view has to be tempered by the second; the issue can only be resolved by industry specific studies. Dalvi surveys theories and types of regulation. He suggests that the British regulatory system that relies more upon negotiation and co-operation, "regulation with a loose rein", may be better suited to developing countries. There is more discretion and less transparency but a subtler balancing of conflicting interests is possible. The American system, in contrast, is legalistic and confrontationist. Katrak explores regulatory requirements thrown up by the expansion in international joint ventures.

There have been so many studies of poverty in India that we tend to be proprietal about them and about poverty. Indian researchers have refined measurement concepts and implemented them on a large scale. Section five is unusual in that it has UK-based researchers applying the concepts to poverty and migration in the UK.

Parts six to 10 turn to macro-economics and explore issues in fiscal, trade and monetary policy, domestic and external liberalisation, growth and business cycles. Writing on such issues is risky in a period of rapid change. The work can rapidly become dated, or turn out to have been mistaken. The future often judges the present harshly. Only deep understanding of institutions, theory and trends will remain relevant. The papers range from tightly focused empirical or theoretical pieces, to perspectives of policy-makers and musings on change. What are some gleanings from them that are still interesting?

Kothari makes the valid point that it is not government consumption expenditures so much as interest payments on public debt and subsidies that are responsible for the growth of current public expenditure. Why did the public debt grow? Borrowing

to finance current expenditure commenced in the early 1980s; in addition, throughout that decade borrowing to provide budgetary support to public sector enterprises remained at 6.3 per cent of GDP, and was brought down only in the 1990s. There is little systematic writing in the vital area of infrastructure. Sriraman offers a useful analysis in the Indian context. Tarapore argues strongly for the prestige, profitability and autonomy of the Reserve Bank. Vasudevan, while also arguing for autonomy of the Reserve Bank, points to the need for adapting reform to institutional structure. For example, regulations that impede integration among financial markets have to be removed before monetary policy can work effectively through the market. Mujumdar warns that Indian conditions and requirements of employment expansion must be kept in mind in designing financial reforms.

Civcir and Parikh use a multivariate co-integration approach to determine long-run nominal money balances in the Turkish economy. They initially assume domestic credit is exogenous and under the control of the monetary authorities. This key assumption of the monetary approach is questionable in the presence of sterilisation. There is an identification problem with single stage estimation, and the coefficient with respect to bank credit does not turn out to be significantly different from zero. Correcting for endogeneity, using two-stage estimation, they find that an increase in domestic credit leads to a decline in reserves as in the monetary approach. But it is real income that brings reserves into equilibrium.

Bokil gives a good overview of the rapid developments in international finance since the sixties and shows the close links of crises to America's macro-economic policies because of the status of the dollar as a reserve currency. The rapid development of private capital markets and international liquidity have meant a fundamental change in the determination of the exchange rates; it is now an asset price, subject to high volatility. But foreign currency markets do not satisfy the efficient market hypothesis. Are controls the answer? But the historical and technological changes that have led to this mobile global capital are difficult to reverse. Can we harness this technology for our good or is it going to destroy us? Developing new global norms is a pre-condition for harnessing it. Romar addresses this question but his solutions are the old Keynesian ones of capital controls, fixed exchange rates and variable domestic interest rates in an environment of global co-operation. If Keynes were alive today he would surely have been more innovative and found a way of taming new developments rather than shutting the door on them. Nayak emphasises the impact of capital flows on exchange rates in the Indian context, and points to the necessity of lowering interest and inflation rates to stabilise exchange rates. It is pleasing to find echoes. Goyal (1997) shares a similar concern.

Chatterji has a neat paper playing around with the effect of the choice of functional form on growth-convergence results. Manohar Rao demonstrates the power of non-linear models combined with indirect inference of parameters, compared to standard estimation, in the explanation of business cycles. There is the advantage of producing the observed random behaviour of macro-economic time series from a simple deterministic system with tight theoretical links, breaking the dependence on exogenous shocks and ad hoc lags, and allowing a new approach to policy and to the predictability of macro-economic variables.

In economics there is a tension between theory and realism. The first makes for understanding and the second for relevance. But by itself the first leads to aridity and the second to clutter. Bertrand Russell's remark that while it is difficult to do good work, it is possible, applies with great force in economics. In India the urgent task is to develop frameworks by which to understand and therefore change our realities. We have to be 'up to date' without a blind application of western theoretical frameworks. This book is an attempt in this direction.

The editors are to be congratulated for their labour of love for the tradition to which they belong and that has nurtured them. One theme running through the book and emerging at different places is the idea of co-operation. Partly this comes from the macro-economic perspective that sees the co-ordination that can remove the obvious waste in any system, but it also has roots in Indian thought. It says much for Vakil's foresight that the issues he thought important are still inspiring research; they have been thrown up again by time. The contributors have by and large followed his maxim: "economists must get into the spirit of Indian economic conditions and give appropriate advice".

Can We Survive without Gandhian Values?

Romesh Diwan

Gandhi's Vision and Values: The Moral Quest for Change in Indian Agriculture by Vivek Pinto; Sage Publications, New Delhi, 1998; pp 176.

AL GORE (1992) makes a strong case that the western civilisation and earth's ecological system are on a collision course because of four strategic threats: (i) global warming, (ii) stratospheric ozone depletion, (iii) loss of living species – both of animals and plants, and (iv) deforestation. These threats have been caused by (i) population explosion, (ii) scientific and technological revolution, and (iii) ideology - our way of thinking; Jaques Ellul (1996) calls it propaganda. The ideology promoted by this consumerist culture is the market ideology: "The market is eternal, the market is unchanging, the market is all-seeing, the market is everywhere. The market is both the natural condition of mankind and the unique blessing of the American Eden. The market is also synonymous with democracy: since it gives the People what the People want, the market is, by definition, the incarnation of the People's will...buying and selling are holy acts, the source of human meaning; all else is empty sophistry...This, then, is the the new consensus worked by the Cultural Miracle: The market is natural, normal and irresistible. Efforts to control its vagaries, however, are artificial, dictatorial, arrogant - and undemocratic" [Frank and Weiland 1997: 260-61].

The major source of this problem lies in greed and over-consumption promoted by market ideology [Diwan 1997b, 1998b]. In fact, consumption pressures from increasing material affluence has doubled in the past 25 years and have destroyed more than 30 per cent of the natural world since 1970 with serious depletion of the forest, freshwater and marine systems on which life depends. According to World Watch studies and a ground-breaking report from the Worldwide Fund for Nature, the New Economics Foundation and the World Conservation Monitoring Centre at Cambridge, overconsumption is accelerating unabated.

The technological revolution and the market ideology have spawned globalisation, a buzz word for the rapid growth of finance and trade spurred on by advances in computer and satellite technology [Diwan 1995]. However, globalisation is not working. It has affected even Americans profoundly; driving down wages and creating job insecurity. With the meltdown of east Asian economies, serious depression in Russia, and growing debt crisis, globalisation has lost its lustre. Even UN secretary general Kofi Annan told Harvard University audience that globalisation is seen as an ideology of predatory capitalism. The perception is unmistakable: millions are suffering; savings have been decimated; hard-won progress in the fight against poverty is imperilled.

The world economy is in stress. In Gore's language: "The more deeply I search for the roots of the global environmental crisis, the more I am convinced that it is an outer manifestation of an inner crisis that is, for want of a better word, spiritual" [Gore 1992:12]. One observes the rise and fall of economic orthodoxy [Diwan 1998c]. It is now recognised that American Indians are sages and not savages. There is now a space for alternative ideas, specially for Gandhian vision and values. That makes Vivek Pinto's book under review both important and highly relevant.

The basic question this book asks is: Can the ethical and moral principles with which Gandhi experimented initially in *Hind Swaraj* and then in his agricultural communities serve as the basis for reconstructing a harmonious, poverty free, non-violent and self-reliant society? The answer is, of course, yes and consistent with earlier analyses [Diwan 1985]. In Pinto's own words, "It is my contention... as it was Gandhi's, that the malaise affecting the Indian nation is primarily moral and only secondarily economic and political" (p 67).

Based on Pinto's PhD thesis, it is a short book divided in four chapters. Gandhi described his struggle as a war between truth and falsehood. This is derived from Gandhi's religious heritage and two personal experiences: (i) June 1893, when he was physically ejected from a railway compartment at Maritzburg railway station, so well depicted in the film 'Gandhi', and (ii) during mid-1906 whence he volunteered in the military's ambulance service both for Europeans and Zulus during the Zulu war where he witnessed first hand British atrocities through ferocious use of machine guns, floggings and hanging of Zulus. This made him question intensely about Britain as a nation of civilised people. He realised that the truth is on the side of the Indian community. Hence it must win. This idea is discussed at length in chapter 1, entitled, 'Hind Swaraj: Context and Text for Gandhi's Religiously Shaped Views on Agricultural Development'. Gandhi had a great faith in the common man, specially a peasant. A peasant earns his bread honestly. He has an ordinary knowledge of the world. He knows fairly well how he should behave towards his parents, his wife, his children and his fellow villagers. He understands and observes the rules of morality. The self-reliance on their own hands and feet builds their character and makes them true votaries of swaraj, practitioners of ahimsa, and fearless, thereby inculcating in them the conduct most suitable for satyagrahis. Therefore, the village is the epicentre of civilisation. Civilisation is the creation of institutions and structures in which not only basic material needs of human beings are met, but also, and more importantly, where individuals are filled with a sense of their spiritual and social obligation to one another and society. The civilisation success lies in this conduct based on character, ethics and morality derived from religious values.

Chapter 2, 'Relation of Gandhi's Religious Perspectives to Agricultural Issues: An Exploration of Theory and Practice, 1909-1948' describes Gandhi's practices in four ashrams: (i) Phoenix settlement, a farm near Durban, Natal 1904-14; well discussed in *Indian Opinion* – 1903-14, (ii) Tolstoy Farm made up of 1,100 acres near Johannesburg, May 30, 1910-January 1913, (iii) Satyagrah [Sabarmati] Ashram, Kochrab to Ahmedabad, May 20, 1915-1933, and (iv) Sevagram Ashram, Segaon, Wardha, April 1936. The ashrams were run on high moral principles: brahmacharya, truthfulness, manual labour, duty to strengthen character, fearlessness in opposing injustice, and vow of poverty. From these principles followed the daily conduct of: simple life, seeking right education, vegetarianism, maintaining good health, self-sufficiency, belief in nature cure and industry. The objective of the ashrams was not only to develop persons of character but also viable communities. The goals of the community were communal harmony, simple sustenance, respect for the dignity of labour, values that enhance spiritual well-being, pursuit of socio-political aims. The relevant concepts then are: duty, equality, brotherhood, service, simplicity, manual labour, ahimsa, frugality and no private ownership of land. For analytical purposes, it uses six concepts of Gandhian economics: swadeshi, aparigraha, bread

labour, trusteeship, non-exploitation, and equality developed in [Diwan and Lutz 1985]. Gandhian economic policy is now summarised in a forthcoming *Encyclopaedia of Political Economy*.

Chapter 3 is 'A Review of Planned Agricultural Development in India and a Gandhian Critique, 1951-1974'. It describes historically, Nehru's Macaulyite ideas that defined agricultural policies. The discussion is in terms of plan investments, price policy and sectoral terms of trade, bias in agricultural planning, green revolution and land reforms. These are looked at from the objectives to promote equity and social justice. It asks such questions as: to whom did the proportional benefits of this strategy accrue, specifically, which strata of farmers, regions and crops? What was the price of modernisation? Were prices used for manipulative purposes? Did it polarise the countryside? etc.

Like many other scholars before, the author concludes: "there does exist a bias not only in investments, but also with respect to price policies, terms of trade, and the role of the state. Agricultural development has been geared to the big farmers with urban ties, irrigated land and a marketable surplus" (p 100). The analysis is taken forward by subjecting it from the lens of Gandhian economics outlined in the earlier chapter. The crisis that affects Indian agriculture is only symptomatic of the economy and politics of agriculture, "at its heart the predicament is moral". The path proposed for recreating Indian agriculture is formulated on Gandhi's moral and ethical principles.

The last chapter discusses, 'Development with a Human Face: Gandhi's Constructive Programme and Current Alternatives'. It summarises Gandhi's constructive programme whose key elements have been to establish communal unity, removal of untouchability, promote adult education, develop non-violent unions and abolition of social evils. Sarva Seva Sanghs provide the operational and organisational structure for a constructive programme. Contrary to public perception, many principles of constructive programmes have taken roots in India and Vivek Pinto provides examples of three contemporary institutions: Self-employed Women's Association (Sewa), Ahmedabad, Gujarat; Anna Hazare's experiment at Relegaon Siddhi, Ahmednagar district, Maharashtra; and Self-imposed land-use plan in Seed, near Udaipur, Rajasthan. There are other such activities currently taking place in India [Diwan 1997a].

The conclusion follows, namely, that development is possible only if moral values are directly integrated. The market economic system defines wealth in material terms only. Thereby it distorts the production process destroying family and community. Scholars now contend that in addition to material wealth there is also natural wealth; estimates suggest that natural wealth is much larger than material wealth. There is also wealth of the third kind; namely, relational wealth [Diwan 1998b]. A proper "test of every policy is not profit, employment or growth, but how it strengthens family and community, individual character and sensitivity" (*Hinduism Today* 1998). Relational wealth adds to natural wealth and requires conduct based on ethical and moral values. It is now recognised that our world cannot survive without Gandhi's vision and values. Inheritors of the old Mayan and earlier civilisation are asserting the values of their heritage. Hinduism is in renaissance and Pranakrishnan Adhikari and Frank Morales estimate 1-2 million "Hidden Hindus" – white practising Hindus in North America alone. Even in US, the land of the brave and corporation sacred cows, corporate welfare is being documented (*Time*, November 9, 1998). Vivek Pinto's book is thus very timely.

No doubt, one can find disagreements with certain arguments and statements – e g, the suggestion that late Sukhamoy Chakravarty's views on planning, based as these were on leftist conventional wisdom of the day, are consistent with those of Gandhi. Overall, this book brings common sense and wisdom to every day problems in agriculture. Like Dennis Dalton's book on Gandhi, it is full of quotes from original sources and provides a wealth of information. Unlike that book where Gandhian ideas of *Hind Swaraj* are neither understood or appreciated [Diwan 1996]; Vivek Pinto shows a clear grasp of such ideas and concepts. His treatment on swadeshi is a good one, and all the more important in view of its essentiality for our current malaise [Diwan 1998a]. It is a highly readable and persuasive book. It deserves to be and will undoubtedly, widely read.

REVIEW OF WOMEN STUDIES

Resilience of Gender Inequities
Women and Employment in Chennai

J Jeyaranjan
Padmini Swaminathan

Policies to increase women's wage employment often choose to take the easy way out by facilitating the setting up of industries that are seen to be compatible with women's household responsibilities rather than address the constraints that force women to, in fact, work in so-called women's work. This paper attempts to map the diffused manner in which wage earning women workers experience oppression which is the outcome of the interplay of both patriarchal structures and capitalist relations of production. The location of the study is Ambattur in Chennai, one of the oldest industrial belts in Tamil Nadu.

I
Introduction

THE last decade has seen a turning away, particularly by feminists, from attempts to construct overarching systems or logics of oppression to explain the persistence and resilience of gender inequities in society. The explanatory value of monolithic structures like capitalism and patriarchy, and the hegemonic characteristics attributed to these structures have increasingly been questioned, since, more often than not, the way these have been theorised and applied, tend to imprison societies and women in a permanent no-win situation. We agree with Pringle's suggestion that, "rather than imposing on 'women' the identities of potential overthrowers of the patriarchal order, it is better to start with practical questions about empowerment and disempowerment. The kinds of generalisations that are appropriate do not begin with questions such as 'where do women fit into the system of patriarchy?' but with practical questions geared to finding out how women are disempowered in particular situations" [Pringle 1995:210].

In a modest way this paper attempts to map out as concretely as possible the diffused manner in which wage earning women workers experience oppression which is the outcome (in this case) of the interplay of both patriarchal structures and capitalist relations of production. This interplay simultaneously results in both empowering and disempowering situations for women at a point in time; over time, however, while "significant destabilisation of patriarchal categories and residues" [ibid] is possible and sometimes discernible, gender inequities not only persist but also exhibit a measure of resilience.

The focus of our study is the conditions of employment of labour (particularly women labour) in the changing industrial scenario of Ambattur. It is a micro effort to address what in effect is a macro concern, namely, the nature and quality of employment being generated in the economy. At the macro level, the post-reform period has been associated with growing employment opportunities for women especially in the export-oriented industries. However, these claims of increased employment generation are not generally supplemented with information on the nature of employment and/or the terms and conditions under which labour is employed in these emerging industries [Custers 1997]. Simultaneously, by addressing women labour in particular we hope to capture the gendered nature of the labour market as well.

Ambattur in Chennai is one of the oldest industrial belts in Tamil Nadu. It has a long history of state induced industrial activity which in turn has spawned the growth of private formal and informal industrial activity. Over the years and particularly since the nineties the character of industrial activity in Ambattur has undergone a sea-change: a predominantly engineering industry-based area has now seen the proliferation of readymade garment and leather finishing units catering to the export market. These newer units now employ relatively large numbers of women.

According to data provided by the Ambattur Industrial Estate Manufacturers' Association, the Ambattur industrial estate is one of the largest in Asia covering almost six sq km. area. It was established in 1963 and currently (that is, in 1998) has 2,000 small to medium enterprises. The combined turnover of these units is approximately Rs 2,000 crore, while they employ about 2,00,000 people. About 30 per cent of these workers are women.

The Ambattur estate is dotted with several different industries. We chose to focus on garment, leather and to some extent the engineering industry. This does not in any way reflect the composition of units either in Ambattur or in the Ambattur industrial estate. In terms of scale of investment and number of workers, engineering is the dominant industry. Since our primary focus is on the conditions of employment of women labourers, we deliberately chose those industries where the concentration of female labourers is quite high and hence the choice of garment and leather industries. The engineering industry which has a long history in Ambattur has been chosen for comparison purposes only. Moreover, garment and leather industries have boomed in the 1990s. While the importance of garments in the export basket of the country needs no elaboration what also needs to be highlighted is the fact that the growth of the textile products industry in Tamil Nadu has been spectacular (particularly since 1991-92) whatever be the indicators used – fixed capital, value of output, value added or employment growth. One important factor that has enabled the Indian exporters in gaining ground in the international market, albeit at the lower end of the product spectrum, is the availability of relatively cheap labour. More specifically, women labour is available to the industry in large numbers and at an even lower wage.

Our survey covers 466 labourers comprising both males and females and they are distributed across the three selected industries (Table 1). The fieldwork was conducted in 1997.

We need to introduce a caveat at this juncture. The discussion that follows does not emphasise two aspects, namely, (a) the

We are grateful to Padmini Swaminathan who has put together the selection of articles forming this issue of the Review of Women Studies.

–Ed

form of the enterprise where labour is employed; and (b) the organisation of production within an enterprise. In our reading of the literature on this subject we found that both these aspects have been fairly well covered. Besides, in an earlier study on conditions of labour in Ambattur, Kalpagam (1981) has dealt in some detail with both these questions. Our preliminary enquiries revealed no significant change in both these aspects despite the lapse of 18 years. Rather than repeat what has already been fairly well-documented we have chosen to study such aspects, the interplay among which, gives us an idea of the logic of the functioning of the labour market (particularly the women labour market) in Ambattur.

The plan of the paper is as follows: Section II provides a general profile of the wage workers in Ambattur in terms of age, education, experience, marital status, wages earned, contribution to family income, etc. In Section III we have attempted to capture the complex interconnection between these different variables. Section IV draws out the broad conclusions of the study.

II
Profile of Wage Workers

The labour force in Ambattur is relatively young though the industrial estate has been in existence for a long time. About 37 per cent of the sample labour force is in the age group of 25-29 years and about 70 per cent of the labourers are below 29 years (Table 2). Importantly, less than 10 per cent are more than 35 years old. If we presume that labour enters the market at the age of 20, we find only 10 per cent of the labour force has stayed on for 15 years and cross the age of 35. Another notable feature is that about 11 per cent of the labour force is below the age of 19.

When we disaggregate the data by sex, we find the broad patterns to be similar, viz, a majority of both male and female labourers are in the age group of 25-29 years and very few of them are in the higher age groups. However, one can discern certain important variations within this broad pattern. While only 2 per cent of the sample male workforce is below 19 years of age, about 15 per cent of the female workforce is from this age group. At the other end, while about 32 per cent of male workers are drawn from the age group of 30-35 years, the share of female workers from this age group is around 19 per cent. This indicates that the female labourers enter the labour market relatively young and also quit early when they cross the age of 30. This peculiar feature of women entering the labour force early and quitting it shortly as compared to male labourers is not unique to Ambattur alone [Elson and Pearson 1981]. The census data vouch for such a pattern in different parts of the country as well as for the country as a whole as far as women's non-farm employment is concerned.

Levels of Education

Though most of the labourers have entered high school (about 69 per cent), only about 36 per cent have completed it whereas about 33 per cent have dropped out before completion of high school. Hardly 10 per cent of the sample labour force has continued its education up to higher secondary or beyond. Importantly, about 17 per cent of the sample labour force had never been to school and remain formally illiterate. Differentiating the data sex-wise does indicate that males are better educated with about 41 per cent completing their secondary education as compared to only about 36 per cent of the sample women

workers. It is not that women labourers have not entered high school. We find that the combined percentage share of middle and secondary level education is the same for the male and female labourers at about 68 per cent. However, there is a greater incidence of drop out among female labourers as compared to males. This is evident from the fact that while only 27 per cent of the males have quit the educational stream before completing eighth standard nearly 35 per cent of the female labourers who have enrolled in high school have quit schooling before completing eighth standard.

Another notable feature is that the incidence of illiteracy is higher for male labourers when compared to female labourers.

To sum up, educational attainment among male labourers seems to be polarised, with their share in both illiteracy and higher levels of education being greater as compared to female labourers. Thus, while the literary base among the male is smaller, their proportion in the higher education levels is greater than that for female labourers. On the other hand, a large proportion of female workers enter the educational system but quit quite early thus having a negligible presence at the higher levels.

Have these dropouts and/or illiterate workers started working at a very early age or immediately after quitting the educational stream? The years of experience gained by these labourers could probably indicate whether they have entered the labour market as soon as their school life ended.

Majority of the workers (about 58 per cent) have an experience ranging from two to five years.

The general pattern of a greater proportion of labourers having work experience between two to five years does not vary between male and female labourers. However, male labourers seem to have stayed on and gained more experience as compared to the female workers. While about 28 per cent of the sample male labourers have more than five years of experience only about 13 per cent of the female labourers have reported such a level of experience. We find that about one-third of the sample female labourers have an experience of less than a year. On the contrary, hardly one-sixth of the sample male labourers have such a low level of experience. Thus, we find that only a small proportion of the women workers have stayed on to gain more experience. It is quite unclear as to why the majority have quit the labour market fairly early

To comeback to the earlier question as to why so many women labourers have quit the educational stream, data on the level of experience along with age profile suggests that discontinuation of schooling was not immediately followed by entry into the labour market.

To elaborate, nearly 56 per cent of the women workers surveyed in Ambattur are either illiterate or have discontinued schooling after the eighth standard (Table 5). If we assume that those who enter the educational stream do so at the age of five, then they must have been 13-15 years old when they discontinued after eighth standard. If, after discontinuation of school, they had entered the labour market at the age of 15, they would have clocked an experience ranging from five to nine years by the time they reached the age of 20 or 24 years. We do not find such a pattern in Ambattur. While almost 57 per cent of the sample women workers are either illiterate or educated up to eighth standard, only around 12 per cent of the women workers have an experience of 5 to 10 years. Another associated feature is that only about 22 per cent of the sample women workers are in the age group of 20 to 24 years (Table 5).

We find a similar pattern among male labourers as well. But the phenomenon is not as acute as it is in the case of women workers. While about 50 per cent of the male workers were either out of school or had never been to school, nearly one-fourth of male workers had work experience of more than five years but less than 10 years. Thus, the available data suggests that discontinuation of schooling has not been followed immediately by employment. There could be other reasons why workers had been forced to give up schooling.

Marital Status

So far, we have noted that the sample women workers in Ambattur are young, less educated than their male counterparts and are also relatively less experienced. One probable reason for this scenario could be the debilitating role of patriarchal relations and structures. At one level, working women have to constantly struggle to overcome the stigma attached to working outside the home. Simultaneously there are compelling material requirements that force many women into the labour market. Marriage, for women, imposes an added dimension in their battle against inimical patriarchal forces. The delicate balance that needs to be maintained between the material status of the household into which a working woman marries and the (perceived) social status of the marital household, decides for the most part whether a woman will continue to work outside the home or not. During the course of our interviews most of the unmarried women labourers responded that their continued participation in the workforce would depend entirely on the decision of their future spouse. If their husbands decide that they shall not go to work, they would definitely quit and stay back at home. Since we have not interviewed labourers who had discontinued work after marriage, we are unable to map out the process of such decisions. But what emerges clearly is that the decision to work in the factory – when, how long, and at what stage in

Table 6: Distribution of Workers by Marital Status

Marital Status	No of Workers	Per Cent	No of Male Workers	Per Cent	No of Female Workers	Per Cent

their lives – is clearly not merely a matter of personal choice for the women workers. These are some of the reasons why many of our respondents opined that their current employment could be a passing phase.

How many of these women are in such a 'temporary' phase? When we look into the marital status of the sample workers we find that nearly half of the female labourers are unmarried. Similar is the case for male labourers as well. The fact that about 50 per cent of the women workers are yet to marry, indirectly indicates the extent of volatility and the level of turnover in the female labour market of Ambattur.

A similar marital status pattern among male labourers in Ambattur could be due to the fact that the labour force (in the industries we have chosen to analyse) in Ambattur is young. But unlike the women workers, male workers stay longer in the market as indicated by their longer years of experience suggesting a relatively low turnover among them. The patriarchal ideology pressurises the male to get to work and earn. Men are stigmatised if they remain unemployed for long or if they are perceived to be earning less than the women in the family. This same ideology however mounts countervailing pressures on the male and female, dictating to a considerable extent, the nature, composition and the functioning of the labour markets. It, at the same time, stigmatises unemployment among male and employment among female. However, a monocausal account in terms of patriarchy alone cannot explain why one half of the sample female labour force is married and/or why some women continue working even after marriage. It is clear that there are other forces at work and need to be reckoned with.

It is possible that the material conditions as revealed by the financial flows of the individual labourers together with that of their households could have an overriding influence at least momentarily over patriarchal dictums. Simultaneous operations of patriarchal forces and material considerations with varying intensities does render fluid the decision-making process which either compels women to stay at home or find a job. It also signifies the impure form of the labour market while negating the exclusive influence of either patriarchal ideology or material conditions on the labour market. That is the reason why, while many women claim that they would decide about their continuation in the labour market after their marriage, another half of the labour force participates in the labour market even after marriage.

However, we need to exercise some caution while interpreting the participation of married women in the labour market. Such workers may not continue to work for long and may quit the market as soon as they are asked to do so by their husbands/marital homes. This could be a reason why the experience level among women is relatively low despite the fact that half of the sampled women workers are married. The fact that only 28 per cent of the female workers are above 29 years old as compared to about 40 per cent of the male workers in the same age group, to some extent, supports our contention that (keeping employers' decision on the marital status of their women workers constant), while the force of patriarchal structures would work towards women withdrawing from the labour market after marriage, the material conditions of the household would require that many married women continue working at least for some time.

Monthly wages received by the individual labourer is the most crucial material aspect that decides their overall location in the material matrix of society. We find from Table 7 that about 80 per cent of the sample workers in Ambattur earn a monthly wage of less than Rs 1,500. The largest number of labourers fall in the wage slab of Rs 501-1,000 (about 36 per cent). A significant number earn less than Rs 500 p m. The distribution pattern suddenly turns sticky when we move to higher wage slabs.

We also find interesting variations in the levels of pay across gender. Similar to educational qualifications, the pattern is polarised for male labourers and clustered for female labourers. About 30 per cent of the male workers earn a monthly wage of just Rs 500; another 46 per cent get a monthly wage in the range of Rs 1,000 to Rs 2,000. In contrast, more than 80 per cent of female workers are concentrated in the income slab of Rs 501 - Rs 1,500 p m. Just around 6 per cent of the female labourers earn less than Rs 500 per month. The difference in wages earned is less sharp among male labourers than among

female labourers when we move to higher income slabs. Another interesting feature to be noted is that while hardly 3 per cent of the male labourers earn more than Rs 3,000 p m, about 6 per cent of the sample female labourers account for this income slab.

To sum up, distribution of male labourers across various wage slabs constitute a wider spectrum as compared to female labourers. Moreover, their distribution is polarised whereas for the female labourers the distribution is clustered. Surprisingly, about one-third of the male labourers are earning less than Rs 500 per month. The obvious query that emerges from this pattern is the quantum of family income of each worker and the contribution of each worker to the family income.

Family Income of Workers

An examination of the total family income of the workers can indirectly indicate the material background of these workers. We find that, for both male and female workers, the distribution is concentrated at the lower end of the income range (Table 8). For more than 70 per cent of the workers, the total family income is below Rs 4,000 p m; for about one-tenth of the sample labourers, family income is less than Rs 1,000 p m. Most of the sample workers are in the family income range of Rs 2,000 to Rs 3,000 p m. The next large group has a family income between Rs 1,000 and Rs 2,000 p m.

When we consider the distribution pattern across gender, we find that, while only 3 per cent of the male labourers' family income is below Rs 1,000 per month, about 15 per cent of the female labourers' family gets a monthly income of just Rs 1,000 p m. More importantly, most of the female labourers hail from poorer families whose monthly income is comparatively lower. While nearly 63 per cent of the female workers reported their family income to be below Rs 3,000 p m, only 42 per cent of the sample male workers reported this level of family income. At the other end, while about 38 per cent of the male labourers' family receive a monthly income of more than Rs 3,000 only 31 per cent of the female workers hail from families whose monthly income is in that range.

The fact that most of the women workers are from relatively poorer households indicates the tremendous economic pressure that overrides, at least temporarily, conventional patriarchal norms and 'forces' women into the labour market [Joekes 1985]. This overriding (probably temporary) importance of material condition should manifest itself in the significant contribution of women workers to their family income. Let us analyse the share of individual labourers' income in total family income.

The share of the individual worker could be 100 per cent if that worker happens to be the sole breadwinner of the family. This share would decline with every additional earning member in the family. Given the fact that the total family income of a large number of workers is within Rs 3,000 p m there is a possibility that very few families have more than two earning members.

We find from Table 9 that, for about 37 per cent of the labourers, their contribution ranges from one-fourth to one half of the total family income. About three-fourths of the family income is earned by another 25 per cent of the labourers.

The general impression, given the prevailing patriarchal ideology, is that the male would be the sole breadwinner for the household or, at the most, the wage income of the women would supplement the male wage income. Surprisingly, only about 17 per cent of the sample male workers of Ambattur fall in the category of dominant wage earners with their contribution accounting for more than 75 per cent of the total family income. In contrast, about 30 per cent of sample female workers are the primary wage earners of their households contributing more than 75 per cent of the family income or the entire income. Thus, we find, an overriding influence of material conditions in at least about one-third of the sample women workers' households. It is also evident that the pressure on such female workers to continue in the labour market could be very high as their wage is absolutely essential to sustain the family.

Table 10 gives an idea of the occupational segregation among male and female labourers studied in Ambattur. There are two features to be noted in this distribution. While we do not find any difference in the percentage share of tailors among males and females, a greater proportion of women labourers are helpers as compared to males. At the other end, physically taxing work like ironing is also undertaken predominantly by male labourers.

Wage Discrimination in Labour Market

A general observation across labour markets (organised and unorganised) is that women are discriminated in fixing the wages. For the same kind of work, men are generally paid more. Does Ambattur labour market reveal such discrimination based on gender?

To throw some light on this aspect of the labour market, we consider the entire sample population and group them by their occupational status and gender location (Table 11). The gross wages for each occupational group is calculated to arrive at the average wage per month per person. We find that there is discrimination against women in certain occupations and in certain others females are paid more than males on an average. But a closer look indicates that women are discriminated

Source Survey data

against as they are paid only marginally higher than men wherever this phenomenon occurs.

Women helpers, inspectors, and cutters, are paid only 53, 64 and 61 per cent respectively of the average wages that men labourers draw in these occupations. On the other hand, women are paid 117 and 126 per cent of average wages that men labourers draw in the occupations of ironing and tailoring.

In other words the deviation in favour of women is only to the tune of 17 and 26 per cent in some occupations whereas the deviation against the women ranges from 36 to 47 per cent.

Given the high level of turnover and consequently a low level of experience among the sample workers, we tried to ascertain the status of employment. This was recorded essentially by eliciting the perception of the individual sample labourers. The distinctions among the categories of permanent and temporary were blurred to a significant extent in the perception of the workers. We have not resorted to any legal definition nor have we checked any legal papers like appointment order of individual labourers as they rarely exist

If a labourer is provided continuous employment in a firm, then the labourer perceives that s/he is permanently employed in the unit despite the fact s/he does not have any legal document. A semblance of permanency is also introduced in the wage structure with bonus and meager annual increments in the salary. However, there is hardly any legal protection for the labourers. It is also important to note that these categories are so loosely used with no fixed meaning, many labourers were unable to perceive their position within the available categories.

Overall about 33 per cent of the labourers perceived that they are permanently employed (Table 12). However, about 57 per cent of the labourers were clear that they are not permanently employed and they perceived their status to be either casual or temporary.

Surprisingly, the perception about permanency in their employment is widely prevalent among female labourers (about 40 per cent) as compared to male labourers (about 16 per cent). On the other hand, while about 80 per cent of the male labourers perceived their status to be either casual or temporary, only about 48 per cent of the female labourers thought so. However, about 11 per cent of the sample female labourers, found these categories inadequate to express any perception of their status of employment.

It is our contention that the complex interplay of poor material conditions and patriarchal forces, both at home and in the labour market, is an important reason why capital is not only assured of a continuous supply of women labour but is also able to get this supply relatively cheap. This contention is based on what the data has revealed to us thus far, namely, women's low level of work experience, gender selectivity in occupation and contractual conditions, gender discrimination in wages earned – all these, despite the fact that a significant proportion of the women workers are almost the sole breadwinners of their households and/or contribute more than 75 per cent of the total family income.

III
Features of Ambattur Labour Market

So far we have focused on the general profile of the wage workers in Ambattur and discussed each aspect separately. However, the functioning of the labour market is more complex and is the product of the interplay of these disparate aspects that we have discussed independently. Our concern in this section is to map out the interconnection between these variables and understand the functioning of the labour market.

Condition of Employment and Wages

We have noted in an earlier section that many respondents, particularly women workers have perceived their job to be permanent. Given the fact that the employers introduce a semblance of permanency among workers by notional annual increments in their wages, there should generally be clear differences in the wages received by casual, contract, temporary and permanent workers.

We find that among males none of those who perceived themselves to be casually employed, earned more than Rs 2,000 p m. On the other hand, while about 50 per cent of the male labourers who claim to be permanently employed earn more than Rs 2,000 p m only one labourer who claims to be permanent earns more than Rs 3,000 p m. About 90 per cent of the temporary male labourers earn less than Rs 2,000 p m (Table 13).

Among the female labourers, that the wages paid are generally lower than that

paid to males is clearly evident. Irrespective of their status, very few women workers earn more than Rs 1,500 p m. Though about 40 per cent of the female labourers perceived themselves to be permanent, nearly 73 per cent of these workers are no different from other categories of labourers viz, casual and temporary in terms of wages earned. They earn between Rs 500 -Rs 1,500 p m. However, none of these perceived permanent female labourers earned less than Rs 500 p m as opposed to the casual and temporary women workers (Table 14).

One significant point to be noted is that about 16 per cent of those who claimed to be permanent among women workers are in the top income bracket earning more than Rs 3,000 p m.

Hence, we conclude that the notion of permanency among the workers is not without any basis as the wage level, at least for some, do reflect the difference. Simultaneously, the perceived permanency has not endowed any extra income as a significant number earn only as much as their counterparts who classify themselves as casual or temporary. Could this perceived permanency by many women labourers be due to more experience? This question emerges as many of our respondents stated that they can work in the same unit as long as they wish unless the unit is closed down. Hence we attempt to relate the condition of employment and the years of service of the labourers.

We find from Table 15 that though 21 male labourers claim to be permanent, only five among them have an experience of more than 10 years while for nine of them, their experience is between five and 10 years. These two groups constitute about 60 per cent of those who perceived themselves to be permanent among male workers. Though we do have such experienced workers among the casual and temporary workers, only 11 per cent of the casual male workers and 28 per cent of the temporary workers have more than five years of experience.

The association between perceived permanency and years of experience among female workers (Table 16) is not found to be as strong as it is among males. While about 66 per cent of the male workers of permanent nature had more than five years of experience, only about 23 per cent among the permanent female labourers have that level of experience. Further, among the female workers, only about 4 per cent of casual workers and 5 per cent of temporary female workers have more than 5 years of experience.

Age of Workers and Level of Experience

We have argued in an earlier section that an important reason for the high level of turnover of labour in Ambattur could be the operation of patriarchal forces, both at the household and at the workplace. Turnover of labour here is measured indirectly through the level of experience. It is true that experience would at best capture only those workers who have stayed on in the market. But for our purpose of understanding whether age is any indication of experience, we need not be constrained by this limitation of turnover as an indicator.

Another question that we had attempted earlier is the level of education of the labour force. We found many women enter high school and quit before completing eighth standard. Have they entered the labour market immediately after school? To answer this question, we relate the age of the workers and their level of experience.

We find that relatively few male workers join the labour force before they are 19 years old (Table 17). This is borne out by the fact that nearly 60 per cent of the male workers whose work experience is less than two years belong to the age group 20-24 years. This should have been the feature even in the past as indicated by the fact that about 50 per cent of the male labourers with an experience of 2-5 years are in the age group of 25-29 years. Similarly, about 60 per cent of the male workers with 5-10 years of experience are from the next higher age group of 30-34 years.

Another notable feature is that since most of the male workers enter the labour market after they had crossed 20, we find every possibility of them completing their schooling.

Among the women workers, about 40 per cent of those with less than two years of experience are not even 19 years old. A few of them seem to have entered the labour market even earlier – they have clocked 2-5 years of experience and are not even 19 years old. About one-fourth of the sample women workers have entered the labour market when they were in the age group of 20-24 years and another one-fourth in the age group of 25-29 years. This could have been the case even earlier. If we consider those with 2-5 years' experience, about 47 per cent are in the age group of 25-29 years. Simultaneously, those who have entered the labour market much younger constitute about 22 per cent while another 22 per cent account for the older age groups.

This indicates the volatile nature of the female labour market in Ambattur. These workers enter the labour market any time but before they are 34 years old. But they do not stay for long. There are only eight labourers in the age group of 34-39 years with 5-10 years experience and there is only one labourer from that age group with more than 10 years experience.

From the above discussion we can surmise the following. while the patriarchal organisation of households enable males to complete schooling, the same structure does not seem to allow the labour market to crystallise in the case of women. The girl children are withdrawn from the school and sent into the labour market even before they are 19 years old. While some others

enter the labour market immediately later when they are 20 -24 years old, an equal number enter the labour market much later even when they are more than 25 years old. Such decisions at a later age to go to work could be due to sheer economic pressure. Probably because of entry into the labour market at various time points, and ages, and also because of being in the job for a short span of time, women workers' wage is clustered at the low end.

Let us now move on to discuss the importance of these wages for the labourers and their households. As we have discussed earlier, patriarchal pulls and immediate material conditions could be working in opposite directions and consequently will have varied meanings for the male and the female labourers.

Marriage is an important medium through which the ideology of patriarchy is operationalised. As we have noted earlier, most of the unmarried women workers felt that their continuation in the labour market would depend on the decision of their marital household. We also noted that about half of our sample women workers are married. This, together with the fact that women workers enter the labour market at various points in their life but stay only briefly, indicates complex processes at work. It is not that the decision to work is made immediately after marriage in all cases. Similarly, it is also clear from our data that the decision to quit is not forever. These are some of the possible reasons for the flux in the female labour market.

Similarly, the material conditions could also vary across households and between natal and marital houses. Besides, the location of the household both, spatially and in terms of resources, is crucial for women's labour. The level of poverty and its intensity in rural as well as urban India needs no elaboration. Added to this misery are the social and cultural practices like marriage and dowry that wreck havoc with the household economies of the workers. While a sizeable number of women workers earn the entire livelihood of their families, there are others who work towards their marriage. Substantial portion of their meager wage is saved to be spent on their marriage. The following section attempts to map the importance of wage income across workers by their marital status.

Family Income and Marital Status

Does the level of family income of the labourers (male and female) vary by their marital status? That may help us to understand the varying levels of contribution of workers to their respective households.

We find that a substantial number of married men and women workers hail from families whose monthly income is less than Rs 4,000 p m (Table 18). This group accounts for about 74 per cent of the married male labourers and 83 per cent of the married female labourers. In contrast, not many unmarried male and female labourers are drawn from such low income families.

It needs to be noted that about 23 per cent of unmarried women labourers are from such families whose monthly income is less than Rs 1,000 and another 21 per cent are from families with a monthly income between from Rs 1,001 to 2,000. This could be the reason why we noted earlier that about 55 per cent of unmarried

female labourers are contributing to the extent of either three fourths or more of their family income.

Family Income and Level of Contribution

The family income could be the important factor that decides the level of contribution of individual labourers. In the case of males, about 61 per cent who contribute less than one-fourth of their family income are from families whose monthly income exceeds Rs 4,000 p m. On the other hand, about three-fourths of those who contribute between 25 to 50 per cent of the family income are from poorer households with a monthly income ranging from Rs 1,001 to Rs 4,000 p m. Almost all others in higher contribution brackets (that is, whose share in family income is 50 per cent and above) are also from poorer households.

In the case of female workers, about 60 per cent of low contributing women workers (that is those whose contribution is less than 25 per cent of total family income) hail from better off families whose income is more than Rs 4,000 per month. In contrast, about 95 per cent of women workers whose contribution constitutes 25 to 50 per cent of the family income are from such families whose income is below Rs 4,000 p m.

The smaller the total family income the higher the contribution of the female workers About 67 per cent of the female labourers contributing between 50 and 75 per cent of the family income are from families with a monthly income of less than Rs 4,000. Those contributing more than three-fourths to the total family income are from still poorer households. About 79 per cent of such women labourers are from families whose monthly income is even less, that is, less than Rs 2,000 p m. In fact half the women labourers in this category are from families with a monthly income of Rs 1,000 p m.

Thus, we find a close correspondence between the level of family income and contribution level. It also suggests that a substantial section of the labour force is from the poorer households and accounts for nearly half of the family income.

That material conditions do often override patriarchal forces is clearly evident from our analysis. However, for the women labourers, this could be a passing phase in their lives and they may well withdraw (be withdrawn) from the labour market. This is a continuous process. Those who withdraw from the labour market might get back into the patriarchal fold of the household while new ones enter the labour market not necessarily by liberating themselves from these forces, but only to get back into it at a latter date – a decision that in turn would be decided by the same forces.

Such an interplay of material conditions and patriarchal ideology is a boon to employers assuring them of a steady supply of cheap labour. More important, it subsidises considerably the cost of production for employers in several ways·

by enabling employers to hire workers on temporary basis without entering into contractual arrangement that are legally tenable, thereby also enabling the evasion of payment of any benefits (statutory or otherwise) to workers like maternity leave with pay, ESI, PF etc. From the women's point of view, this arrangement inhibits the accumulation of experience apart from exploiting them in every way.

Conclusion

Our analysis has brought out the complex interplay of different factors which in turn renders the job market very volatile, particularly for women [Leach 1993]. Women's labour market seems to be in a constant state of flux. In our view there are several underlying factors and forces that hinder the crystallisation of the labour market for women.

In the first place we find that a good proportion of women labour come from relatively poor households, that is, households whose monthly income is less than Rs 500 p m and/or less than Rs 1,000 p m. Hence or otherwise, the income of these women workers constitutes almost three-fourths or the entire income of their respective families. The gender question comes out very sharply in the matter of contributions to household income; a larger proportion of women rather than men (particularly in poorer households) contribute more than 50 per cent (even 100 per cent) of their household income. In contrast the male share of household income exceeds 50 per cent only in relatively better off households.

Secondly, the fact that women labourers belong to relatively poor households and/or the fact that their contribution to family income is crucial, however does not automatically guarantee the continued participation of these women in the labour market. How long and which women remain in the labour market at any point of time depends on the outcome of the interplay between material conditions and patriarchal forces in operation both at the workplace and in the particular household.

As observed by many others, we also find a high turnover of women labour in Ambattur. But the concept of turnover needs to be problematised since it is not necessarily related to the conventional notion of women leaving the labour market on account of marriage or childbirth. Our study has revealed that the aspect of turnover for women is across age and marital status.

An added dimension to the above problem of rapid turnover of women in the labour market is that it hinders the accumulation of job experience as far as women are concerned [Tam 1996]. It is evident from the study that women have a comparatively poor work experience across age and marital status as compared to men. Thirdly another striking feature thrown up by our study is the inability of larger number of women workers (relative to male workers) to complete schooling. The literacy base for women workers is larger than that for men; but more number of men are able to proceed for higher education whereas larger number of women workers seem to drop out before completing school.

The complex interplay of these (negative) factors manifests itself in several ways: one, we find very clearly that the wages for women workers are clustered at the lower ends of the wage slab. Two, the lesser years of schooling, the inability to accumulate work experience because of being pressurised to quit and/or join wage work at the dictate of (patriarchal) households, limits considerably the type of industries, and jobs within these industries, that women can enter. In our larger report on this study (on which this paper is based) we found that, of the three industries studied, the flexible organisation of the garment industry seems to accommodate women with all their constraints. That is, of the three industries, the women in the garment industry are less educated, have less work experience and also come from families that are relatively poor. In our interviews with these women, we realised that quite a few women consciously opted to enter units that did not demand stringent quality control, precisely because they could not cope with stress both at home and at the workplace. On the other hand, women in the engineering industry showed a distinct pattern; they were more educated, had longer work experience and also came from households whose income levels were higher.

And here lies the gender trap. Very often, policies to increase women's wage employment choose to take the easy way out by facilitating the setting up of industries that are, in official parlance, "compatible with women's household responsibilities" rather than addressing the constraints that force 'women to work in women's work'. Given this scenario it is difficult to come out unequivocally with a clear set of policies that will simultaneously address material conditions and inimical patriarchal forces.

Provision of facilities for completion of schooling, vocational training for skill acquisition, implementation of even existing legislation relating to hiring practices and conditions of work at the workplace, etc, may go a long way towards benefiting labour in general including women labour. But it is important to bear in mind that these provisions will meet only (what in feminist parlance is called) the 'practical gender needs' of women [Moser 1981]. They do not entail a strategic goal such as women's emancipation or gender equality; nor do they challenge the prevailing forms of subordination even though these may arise directly out of them. Having said this however, we do not deny the importance of interventions designed to alleviate the specific problems of women workers. But the limitations of such an agenda needs to be recognised if not at least recorded.

[This paper is based on data collected for a study on 'Women and Employment' for the department of women and child development, ministry of human resource development. We are grateful to the ministry for their sponsorship of the study. We are indebted to V Lalitha and P Rajeswari for their painstaking efforts in collection of data at the field, to A Raman for analysis of data; to T Maheswari for producing several drafts of the paper, and to R Dharmaperumal for the production of the final paper.]

Disempowered despite Wage Work

Women Workers in Beedi Industry

Meena Gopal

By employing a system of production using contractors and home-based workers, the beedi industry is able to gain tremendous profit with little inputs in infrastructure and comprehensive benefits to labour. The construction of home workers as housewives and homework as a practice that allows a woman to care for children and perform her household tasks while earning much needed income completely detracts from the fact that not only do women put in long hours to fulfil production targets set by employers but have no idea as to how they arrive at the wage levels they set. Women's subordinate status as workers is built into the production process.

THE beedi industry in Tamil Nadu remains largely concentrated in the districts of Chennai, Chengalpattu, North Arcot, Tiruchirapalli and Tirunelveli and in relatively small numbers in Dharmapuri, Chidambaranar and Kanyakumari districts In Tirunelveli district, Melappalayam area of Tirunelveli town and Mukkudal in the rural Ambasamudram taluk are the oldest centres of the beedi industry. In the district today, the system of making beedis in the factories or workshops is totally non-existent; instead, the system of manufacturing beedis through contractors and subcontractors employing home-based workers is the one prevalent. Unlike many other states such as Kerala or even Madhya Pradesh and Maharashtra, in Tirunelveli there is no coexistence of the workshop system and the system of subcontracting out to home-based workers.[1] Apart from this, Tirunelveli was considered conducive by entrepreneurs from neighbouring states and even from states like Gujarat and Maharashtra, due to the abundance of cheap female labour and favourable climatic conditions. The beedi manufacturing companies possess the trade mark to manufacture and sell beedis. They in turn carry out their production through contractors and subcontractors. At present, there are more than 40 such trade mark holding companies and around 1,100 contractors and subcontractors operating in Tirunelveli.

There is a consensus among employers about decentralisation being the most efficient organisational form for manufacturing beedis. The chief administrator and proprietor of one of the prominent manufacturers in the district of the brand Kajah Beedi, says, "the contract system became prevalent because of the stringent labour laws. Prosecution took place if the registers pertaining to the various welfare measures were not maintained. If a person owned five branches, then five different prosecutions were conducted. A second offence meant imprisonment. So we put the responsibility on the contractor. He deals directly with the worker as regards remuneration and all other benefits" (personal communication, Nazrullah, proprietor, Kajah Beedi Company, 1993). By employing a system of production using contractors, the beedi companies are able to gain tremendous profits with very little inputs in terms of infrastructure and comprehensive benefits to labour. These profit making features of the beedi manufacturers are hardly evident in the interface between the contractors and subcontractors, and the workers. It is at this latter level that manipulation by the employers becomes visible.

In the system of contracting out the production, there are essentially two strains. One, where the trade mark holding company provides raw material to contractors, who in turn issue the tobacco and tendu leaves to the workers at the village level and collect the finished product and deliver it to the company. Companies of brands such as Kajah Beedi, Seyadu Beedi and King Beedi belong to this category. For instance, Kajah Beedi's trade mark holding company is called Rajavelly and Company. It has 47 contractors managing its production in Tirunelveli. The shops managed by the contractors at the village are known as 'company shops'. In the second form, the company provides the raw material to a main contractor, who in turn hands over the raw material to the numerous subcontractors who maintain links with the workers issuing them raw material and collecting the finished product from them. In this form the trade mark holding company is also called the principal manufacturing company, while the subcontractors are also referred to as commission agents. One of the largest beedi manufacturers, the Mangalore Ganesh Beedi Company has as its main contractor, the Muruga Home Industries. The units or the shops managed by the main contractors are called the branches. The Muruga Home Industries has 10 such branches The 30 Number Photo Beedi Company known by its trademark name, Bharat Beedi, another large producer in the district has as its main contractor, the Damodara Home Industries. They engage 69 subcontractors for production in the district. The shops managed by the subcontractors (also known as 'commission agents') at the village level are known to the workers as 'commission shops'. All the trade mark holding companies have their headquarters for the district at Tirunelveli, Melapalayam, or Mukkudal. The contractors and subcontractors for the various companies are those who manage the actual manufacture of beedis.

Raw material, both tendu leaves and tobacco, have to be obtained from states such as Andhra Pradesh, Madhya Pradesh, Orissa, Gujarat and Karnataka. Large companies procure raw material through their own agents, who participate in the tender bid of the tendu leaves every year at their places of production in Orissa and Madhya Pradesh. Others procure the raw material from suppliers and agents who travel to and fro and ensure supply. Companies stock the beedi leaves and tobacco in godowns at their headquarters and despatch the necessary amounts to their contractors as and when required. With respect to the payment of wages and benefits to the workers, the maintenance of registers of service, and the accounts of production, it is the contractors and subcontractors who have the responsibility of dealing with the workers.

On an average, nearly 250 crore beedis are manufactured per month in Tirunelveli district by the home-based workers employed by the various companies. Official records indicate that there are 1.8 lakh home-based beedi workers employed by the various manufacturers in the district, as revealed by the number of Provident Fund subscribers registered at the

Regional Provident Commissioner's Office at Madurai. However, a recent survey by a commission appointed by the Supreme Court in 1989 to enquire into the conditions of those employed in the beedi industry in Tirunelveli district, showed that workers including those having to roll jointly with passbook holders, as well as the unofficial 'chittai' (little notebook), when estimated, reveal that the total number of workers is around 5.5 lakh.[2]

The main contractors such as Muruga Home Industries for Mangalore Ganesh Beedi and Damodara Home Industries for Bharat Beedi Company usually have their offices or branches at taluk headquarters. Each of the branches of the main contractor will usually have about 15 to 20 subcontractors who will run the shops in the villages. The main contractor disburses the raw material to the subcontractor who in turn will deposit the finished beedis at the taluk office at least once a week. Here the beedis are bundled and packed and despatched to the sale points after payment of excise duty. In the case of companies of such brands as Kajah Beedi, Seyadu Beedi, and King Beedi, who operate with just contractors, the latter have their shops at the village level. Each of the contractors, and subcontractors in the former case, may maintain more than one outlet at the village level, one of which will be called the main branch and the others, the sub-branches. These outlets are spread amongst adjoining villages within a block. While the raw material that the contractor gets from the headquarters is kept at the main branch in the village and distributed to the sub-branches in the other villages, the beedis that are produced are bundled and packed at the godowns called packaging centres from where it is despatched to the sale points after paying excise duty. Kajah Beedi has three such packaging centres for the whole district, at Tirunelveli town, Melapalayam and Pavoorchatram. The industry thus has a pyramidal structure with its base at the village level and its highest point being the district.

In Keelapavoor block there are more shops in the southern villages than in the villages in the northern part. Due to the predominance of agricultural activity beedi work slackens in the northern parts during the agricultural season. Regular beedi work only begins once the agricultural season is over. Consequently there are fewer company shops in the villages of the northern part of the block, and a predominance of both company and commission shops in the southern part. The oldest established shops in the block are the T P Sokkalal Ram Sait Beedi Company's shop set up in 1944 in Melakrishnaperi and those set up in Poolankulam in 1954 and 1956. Then the Mangalore Ganesh Beedi Company's commission shops began to be set up from 1969 to the mid-1970s in Pavoorchatram and the nearby areas and continued thereafter to expand. Among the company shops, Kajah Beedi and King Beedi brands from Kerala, and Tirunelveli's Seyadu Beedi were established in the late 1970s. The beedi shops expanded further through the 1980s and continued to grow into the 1990s. In the 1970s there was thus an increase in, and consolidation of the commission shops with many new entrants such as the Khiladi beedi, Desai beedi, 5 number beedi, establishing themselves.

The 1990s saw the entrance of many more of the commission shops belonging to Khiladi and Desai, and also the expansion of established companies of brands like Kajah and newer ones like Arasan Beedi. Between 1992 and 1994, 6 commission shops and 3 company shops of brands such as Kajah, Arasan and Seyadu had established themselves in the block. This meant that the beedi business was proving to be quite profitable. There was a consensus amongst the managers, that the shops and their companies were doing good business. Some of them also said that their companies were expanding by establishing new outlets in the district. While this expansion was going on, many shops of the T P Sokkalal Ram Sait Beedi Company were closing down. This was because most of their workers were older women. Younger workers who were skilled in rolling the newer company 'nool' (thread) beedis which used a thread to tie the beedis, preferred not to roll Sokkalal's 'thumbu' (coconut fibre) beedis which used coconut fibre to bind the beedis and was more conical in shape. Thus competition from other brands and companies, and lack of labour with requisite skill were compelling the Sokkalal Ram Sait Beedi Company to close down their shops in many areas of the district.

Interface Between Workers and the Shops

To begin running a shop, the contractors and subcontractors have to possess a Central Excise licence which provides them with the authority to obtain and disburse tobacco to the women workers, and account for the beedis produced and transported. Of the two types of shops, in the company shops the contractors for the trade mark holding company operate by issuing passbooks to the home-based women workers in their name, giving them raw material and collecting the beedis after paying them the wages for the beedis rolled. They also deposited provident fund amounts in their names, and 8 per cent of their total wages obtained in a month as leave wages. This provision exists in the Beedi and Cigar Workers' Act 1966. The leave wages as well as bonus, given to the workers under the Bonus Act, are distributed twice a year during the festivals of Pongal and Deepavali. Despite the fact that the Maternity Benefit Act covered the women beedi workers, it has become effective only since 1988, with the efforts of the women inspector of labour of Tirunelveli district. Even here only company shops have shown a willingness to give women their maternity benefit dues. In addition to passbook holders, there are workers who rolled in 'joint' status worked along or jointly with passbook holders. They received the wages only for the beedis rolled. The shopowners claim that once these workers' skill and proficiency are established, they too would be issued passbooks. But whether this claim was true became clear, as we shall see later, from the evidence of the women workers in the shops. The company shops are strict about the quality of their beedis, the reporting time for delivery of beedis, and insistence that the workers present themselves in a neat manner.

In the commission shops, the subcontractors operate with the brand name of the principal manufacturing company. These subcontractors, also called commission agents, obtain a commission of 80 to 90 paise to Re 1 or even Rs 1.20 per 1,000 beedis collected and sold, depending on the brand of the beedi from the main contractor. They exercised arbitrary powers because of their weakened links with their principal companies, and the informality governing their relations with workers. The commission shopman collects a bundle extra for every 10 bundles rolled, called 'podu vandal' and thus took from the worker 100 beedis for every 1,000 beedis as his 'own commission' from the worker. While passbooks were issued to women, and a few workers also retained as joint rollers in these commission shops, the subcontractors of some of the manufacturers, such as Mangalore Ganesh Beedi Company (at the time of the study), did not issue the passbooks in the names of the women, but in the name of a male member of the family or even a neighbour to avoid giving maternity benefit. Another dominant practice in these commission shops was the issue of raw material to workers on a little notebook called the 'chittai'. Young girls who are

just beginning to learn to roll beedis or older women whose beedi quality may not match the best quality are given the raw material, but without recognition of a passbook. The workers might not be paid their provident fund amount, bonus and leave wages and maternity benefit, or if so, infrequently. However, in an atmosphere of informality, the shops are also not strict about the quality of the beedis submitted, the time at which one reports at the shop, or even the regularity of rolling.

Sometimes subcontractors of smaller brands will also provide raw material to women in any one of the villages they have shops in, for a non-recognised brand, apart from the regular brand they sell. Women identify this practice as a constant changing of thread of the beedis they roll for. The shopowner may be a resident of a neighbouring village and thus familiar to them, as the shopowners indulge in such practices only after they have established sufficient rapport in a village. One such subcontractor had shops in Pavoorchatram and Tippanampatti, with his main contractor the Malabar Beedi Company headquartered in Tenkasi He would sometimes give the workers green thread and sometimes pink thread to bundle the beedis. The beedis of these non-recognised brands would then be sold to other contractors or to retail outlets. One of these was an imitation of Seyadu beedi, which the women called 'short Seyadu', quite pungent in flavour and very popular in the hill districts of Kerala.

Apart from these two types of shops, there are also traders who set up shops without possessing a brand name. They operate on a small scale with a declaration of annual production less than 20,000 for which there is exemption from the Central Excise licence. Characteristic ally these shops issue raw material and collect the beedis at an appointed hour during the day or night. They may or may not be regular in paying the wages, but will suddenly remove their shop from its place and vanish with the beedis, raw material, money et al, leaving the workers in the lurch. They too indulge in the practice of 'podu vandal', of taking from the worker 100 additional beedis for every 1,000 beedis rolled. They sell their beedis to contractors or bigger merchants who sell it to retail outlets. While they operate they may pay good wages without the passbook and hence no other benefits, and even issue good raw material which was appreciated by the women who rolled for these shops, and they will sell their beedis in an unauthorised manner across the border in the hill districts of Kerala. The shops run by these traders and the smaller subcontractors who sell the non-recognised and imitation brands are popularly known as fly-by-night shops.

Working of the Shops

The beedi shops in Keelapavoor block employ only women as beedi rollers. In parts of the neighbouring Alangulam block, men also work as beedi rollers. A well-established company shop usually has more than 200 workers working for the shop. In Keelapavoor block, both Seyadu and Kajah Beedi company shops, have the highest number of 388 and 362 workers with passbooks, in two of their shops, on their rolls. The distribution of workers in the two types of shops tells us that out of the 50 shops surveyed in the block 19 commission shops have less than 50 workers, while there are none amongst company shops. Eight commission shops have between 50-100 workers, while it is so only in one company shop. There are six shops in both the company and commission shops having between 100-200 workers. And while nine company shops have more than 200 workers, it is only so in one commission shop. Thus commission shops extract the maximum from workers by keeping small and numerous establishments indulging in a variety of arbitrary practices.

Not all workers are issued passbooks. Besides passbook holders, there would be at least half as many 'joint' workers. Incidentally, this practice is more in company shops. A 'joint' worker does not possess a separate passbook but is issued raw material on another worker's passbook with whom she submits her beedis jointly. The joint worker's dues such as wages, provident fund amount, bonus, and leave wages are paid to the passbookowner. The passbookowner deducts her own share and hands over to the joint worker the rest. According to the managers, the joint workers are on test for their skill and proficiency and would soon be issued passbooks. However, many workers claimed that they had remained joint rollers for many years.

The shops also employ men generally as beedi checkers. Company shops have two or more checkers, apart from the disburser of the raw material, called the 'tandoor' who weighs and gives the requisite amount of the leaves and dust to each worker. There are also one or two men who work as stackers of beedis. Seyadu Beedi Company dispensed with this worker and they arbitrarily make the women themselves stack the beedis onto the trays and place them in the sun for curing. Besides, some big companies have packers and labellers in their premises, who work on a piece rate basis.

All the company shops have regular timings from 9 am to 1 pm and 2.30 to 6.30 pm. The commission shops generally open for collection and disbursement for two to three hours, any time of the day between 9 am and 7 pm. This was because one subcontractor would be managing two or three outlets and would have to adjust his time and presence between them by staggering his timings at each outlet. A worker hardly spends 15 to 30 minutes in the shop everyday, given the fact that she produces the beedis in her home. Normally in the company shops where there are set timings to report for giving in the beedis, there may be about 20 to 30 women at a time in the shop. In about half an hour they are sent off and the next lot comes in. In commission shops almost all the women report at the same time.

The company shops insist that women come well-dressed to the shops, with hair oiled. The shopmen draw a parallel saying that just as women in towns go dressed well to offices so also the beedi rollers should come to the shop dressed neatly. This, however, is for the brief 15-30 minutes spent in the premises of the shops to deliver the beedis. Their dealings remain at a personal level, as there is no opportunity for any collective work at the shop.

In payment of wages, arbitrariness was evident. Thirty of the fifty shops paid the wages on Saturday on a regular basis. Nine of the shops paid it on a Thursday or Friday, while five of them paid it on a Sunday. The shopowners had control over the workers by making them come on a holiday to receive their wages or in arbitrarily shifting the date of payment.

An insight was obtained into the shopowners' perception of women's beedi work when 28 of the 42 shopowners interviewed responded by saying that beedi work was spare time work for women. Some of them even qualified it by saying it was work that women did in their free time. Eleven of them said that if it were made a full time work with regular hours of work in a shop or factory, women would not agree to come. They claimed that the women would then not gain the advantages they now had, combining it with their household work and care of children, seeking the help of assistants, which would be lost with supervisors in the workshops hovering over them. Three of the shopowners however admitted that making beedi work into a full time activity meant a greater risk for them, as they would need

a place to house the workers and more staff to supervise and check their work.

The Production Process

The actual labour process of producing the beedis takes place in the homes of the women workers. To understand the details of these mechanisms we chose to look at the village dynamics in Kalloorani. The process of rolling beedis is broken up into various steps and often split among various persons. On return from the shop, the leaves have to be soaked. Once the water drains off, the leaves are cut into rectangular pieces using an 'ace'. a rectangular metal strip, for measurement. Each brand had slight variations in their 'aces'. Then the pieces of leaves are folded in a piece of sack cloth or plastic sheet to retain the moisture till they are rolled. Cutting the leaves is a very skillful job and is done by the beedi worker herself. The responsibility of cutting leaves is shared with younger girls only after the latter have attained sufficient skill. The beedi worker herself does the main work of actually rolling the leaves placing the tobacco dust inside and binding it with a thread. The final action consists of folding the top end of the beedi using a metal stick. This action is often the first piece of work that is handed over to younger girls, when they are initiated into beedi work. Often older women or handicapped women and girls are 'paid' for folding the ends of the beedis and bundling them, at the rate of 60 to 70 paise for every 10 bundles of 14 or 15 beedis. Women sublet this part of the work so that these older and handicapped women earn a few rupees as their livelihood.

Beedi work thus involves women who integrate their lives with their work. These include women and girls folding beedis and assisting other workers, alone or with other labour, or rolling beedis for others all of which constitute the informal beedi work outside the shop sector (Table 1). Young girls from poorer households as well as women who are socially and physically handicapped would be, as we have noted above, among those folding beedis. It is here that the extremes in ages are evident. In Kalloorani, while there are 66.7 per cent and 50 per cent girls below 15 years from the SUPP and SURV representing the poorer (support and survival)[3] households respectively, girls from the (well-off) ACC1 and ACC2 households are comparatively lesser with 33.3 per cent and 31.2 per cent respectively. During agricultural off-season or when there is no work within the households, elderly women from well-off households, help the younger women by folding beedis. More women than girls combine assistance in folding with other labour such as agricultural work. Older women from well-off households, with 23.4 per cent and 18.8 per cent in ACC1 and ACC2 households respectively, help their daughters or daughters-in-law, while women from the poorer households with 15.7 per cent and 50 per cent in SUPP and SURV households, supplement their incomes in other labour, along with beedi work. Women who could afford to spare a little time but who also wished to stay out of the competitiveness of the shops, rolled beedis for other women and were paid by them. Thus, the burden of assistance by which the shops gained, was passed onto the younger girls and the older women of the poorest sections, as well as the women of the well-off households. The women of the poorest households had less choice but the women of the well-off households could afford to take this burden.

Girls gradually try and make their way into the shops while the older and indigent women remain out of the competitive circuit of the shops. Within the commission and company shops, passbook holders, joint rollers and 'chittai' holders worked side by side (Table 2). This disparity in status between the workers even within a single shop is often a reflection of their families' position in the social structure, as well as their own status within the households. In both the company and commission shops, women from the richer households are in greater number as passbook holders. In the company shops, 50 per cent women of the ACC1 households have passbooks, while the SUPP and SURV households have 44.5 per cent and 45.2 per cent women with passbooks. In the commission shops too, 20 per cent women of ACC1 households have passbooks, while 18.6 per cent and 16 per cent women have passbooks in the SUPP and SURV households, respectively. The ACC2 households have a slightly smaller proportion of women possessing passbooks. Thus the well- off households had an edge over other households in having the most secure status, which was ensured to them with passbooks in the shops.

The joint rollers are women from the less advantaged groups. This is particularly so in the case of younger girls who are eager to prove themselves and obtain a passbook soon. The proportion of joint workers are seen more in the company shops and amongst the older women as seen in the 22.8 per cent women in ACC2 households, 13.9 per cent in the SUPP households and 9.7 per cent in the SURV households. Here, the ACC1 households were seen in smaller proportion and hence less manipulated.

Issuing raw material on chittai is evident only in the commission shops. Here, interestingly, women from the richer households and those who survived only on beedi work are found in greater numbers, seen in the 19 per cent women of ACC1 and 19.4 per cent of the SURV households (Table 2). It meant that those who needed extra money and those who had no choice for survival worked shoulder to shoulder on chittai in the commission shops. Thus, women's disparate presence in the production process presented a fertile area for their further manipulation and exploitation in the working of the industry.

Arbitrariness in Terms of Work and Relations of Labour

In the working of the industry, at the level of the shops, different shops had different degrees of attraction for the workers. And even within a single shop workers had different types of relationships with the shop managers. Very often these personal relationships became central in getting them jobs and privileges. Arbitrariness is reflected in the different dimensions of work.

In the nature of formal controls, it is only in company shops that a passbook holder feels secure. Though she realises that her labour is strictly controlled, she feels assured of a proper issue of raw material, wages, benefits like provident fund deposits, bonus and leave wages. If the worker is ignorant of her right to maternity benefit she stands to forfeit it, as usually the company shop does not initiate the payment to the worker. Some companies like Kajah Beedi usually do not deprive the worker of her due. The joint roller does not possess a worker status as she does not have a passbook at all, and receives her wages due for the beedis produced. The company shops take in younger women as joint rollers. The shop owners claim that a joint status is retained till the worker is sufficiently skilled for the period of a few months after which she would be issued the passbook but often this continues for years and in many company shops the ratio of main to joint workers is 2:1 or even more. So if a shop claimed 300 workers on its rolls, the actual number on rolls would be 1½ or twice that number. Sivanammal,[4] who has been rolling 'joint' with her husband's second wife, who also lives in the same household, feels resentful that she is not given a separate passbook but has been forced to continue for many years now as a joint roller, because the shopmen ask why should one household require two passbooks. Often if there were two girls in a family, the passbook was issued to the younger sibling taking the older girl as a joint roller, for if the latter was married then the passbook would have to be altered sooner.

Most other workers are issued raw material with entries made in a little notebook called chittai. The chittai holders are like the joint rollers of the company shops, the only difference being that here, the worker is in a more vulnerable situation and may never graduate to a passbook at all. Such workers receive no benefits and could never hope like the joint workers, of one day obtaining a passbook in their own name.

Child labour is a common practice and operates chiefly at the level of the commission shops. The commission shops absorb young girls of 11 or 12 giving them raw material on the chittai. Chittai workers do not receive any of the benefits given to passbook holders such as provident fund amount, bonus and leave wages. The workers on chittai in the commission shop are paid less wages. The benefit of this unrecorded workers' labour produce goes into the contractors' pocket. In each of the household categories in Kalloorani (see Table 2) 1 to 3 per cent of workers are below 15 years on both joint and chittai. Keeping women and girls as joint rollers and chittai enables the shopowner to maintain his control over them.

Informal relations extend to utilising caste identity for recruiting. Thenkani, 12, who belongs to a support household and is a daughter of a washerman, was sent off to roll on a chittai, for the Desai beedi commission shop in Tippanampatti, 1½ km away, which was run by a man from their caste. "I roll for a shop run by our people", says Thenkani proudly showing off her awkward looking beedis as her own contribution to the commission shop. When the youngsters attain sufficient skill, older women take them to the company shops and recommend them to the shopowner, who, if satisfied and depending upon his relation with the woman recommending, takes on the girl as a joint roller. Women and girls' access and entry into either the commission shops or company shops thus depend upon the contacts they have with older women. If mothers, sisters, or aunts rolled for commission shops, girls could also soon earn a passbook, as informal relations play a far greater role in a commission shop then in the company shop.

Apart from recruitment and the issue of passbooks, where the informality and hence arbitrariness between shopmen and workers exist, it is even more evident in the ensuing relations between them. From the moment the women are inducted into the shops, though legally they cannot be harassed except for some gross misdemeanour, their actual working relationship with the managers depends on the personal relationship they have established and often are subject to the whims of the managers. The informal relations with the shopowner gives him licence to behave in an arbitrary manner. Those who cannot really strike a good rapport keep a low profile. Though there have been some efforts at unionisation it has not had any effect on the commission shopowners, who receive the support of the bigwigs of the village.

Indulging in favouritism and partiality towards some of the workers is a practice less commonly seen in the company shops

Notes. * See end note 3

** In the company shops, apart from passbook holders, there were the joint workers who rolled along with the passbook holders, having no legal recognition. This system was also evident in the commission shops. In addition, another practice, seen only in commission whops was issuing raw materials maintaining the account informally in a little note book called 'chittai'.

and more in the commission shops. Because a higher degree of informality prevails along with women's almost non-existent bargaining power. Women who belong to the well-off households assume for themselves a special status within the shops. They receive favourable treatment from the shopowner, either because their husbands are prominent persons in the village, or due to the degree of informality with the shopowner being greater. With such of his favourites the shopowner is lenient, he even enjoys the vulgar talk of some. Ranjitha related an incident where a women of her own barber caste who, when asked by the shopowner why she was late to the shop, said, "perhaps if I only wore underwear, I could run and reach the shop. It is this saree which has delayed me." Such talk amused the shopmen. With others, if he is annoyed, he is ruthless and breaks their beedis.

Apart from manipulating women through a system of hiring of workers on the basis of personal preference, shops sometimes indulged in arbitrary practices under various pretexts and rationale. Under exploitative practice of 'podu vandal', that is, of taking a certain number of beedis from the worker in the commission shop as his own commission as the raw material is issued and the beedis are collected, the shop managers insist that the worker does not keep back left-over raw material. Then only are they issued fresh raw material. It is in the case of raw material that this arbitrariness is mostly seen. Some of the commission shopowners and even company shops at times issue poor quality raw material. In such cases, women workers are unable to produce 1,000 beedis with the given raw material and end up producing 800 beedis or so. The worker remains fearful that if she argues, the shopowner would withhold further issue of raw material to her. If he did so, it would eat into her wages, as she would have to supplement with raw material from the market; or she would lose wages if he did not give her raw material. He could use reasons such as her irregularity on account of her illness, or her lack of sufficient skill to withhold issuing raw material.

Company shops practise the quota system where they reduce the quantity of raw material issued to half, for two to three days per week telling the workers that sales are less due to monsoons or that beedis are not drying. In the rainy season, tobacco will clot on absorbing moisture and will not smoke sufficiently. Sun-cured beedis are kept for about 16 hours at 104° F temperature in the sun. They have a life of six months. During the rainy months when the beedis are furnace-baked for about six hours at 110-115° F, they have a life of only two months. In such cases, beedis cannot be stored for long periods of time, neither can they be transported efficiently. Therefore the employers pass on the burden to the workers by reducing the tobacco issued to them, saying it would also instil in them a fear of penalty for wastage. Women, being unaware of these detailed processes of storage and transportation and markets, accept the rationale of the employers. With their weak bargaining power they are not able to resist or protest, and claim their due of raw material and wages. In the commission shops, the shopowners refuse to issue raw material on Thursday if the workers have left-over raw material from that given them during the week. The employer makes the workers believe that this is to wind up the account the following day and complete the account for the week. There are also sudden closures affecting work and payment of wages. Delayed payment of wages and reducing or withholding benefits like leave wages or bonus are other practices. Workers who are consistent in rolling, face hardships at such times, having committed payment of chit money or settling weekly debts.

The absence of strong unionisation further adds to their inability. In day-to-day work dynamics, the shop managers have the upper hand. They control timings for reporting at the shop, the quality of the beedis that are brought in and the manner of appearance and presentation of the worker. In the face of the arbitrariness that prevails women are in no position to assert themselves and invoke the laws on payment of minimum wages, bonus and even maternity benefit.

Women's own limitations are the basic lack of knowledge of the outside world, their illiteracy, their feeling of lack of control of their worker status and their relationships at the shop. Practices at the level of the shops such as arbitrariness in raw material delivery and beedi collection, the quota, and sudden closures further add to their difficulties. Burdened by the mechanisms of the shop level functioning and their own perceptions of their position as workers, women are kept out of bounds of the larger and higher levels of the working of the industry. They remain ignorant of the markets their beedis go to, the relations at the level of the district between their shop and the headquarters and the dynamics there, as well as other aspects of the beedi industry of which they are workers. There are those women who understood to some extent what was happening but felt constrained to do anything for lack of support. One of them said, "These women are fools, and they do ask questions in the shops. For them the owner is big brother, and their retort is why should we do him harm? They don't know that he is eating from their labour". Various matters keep the women and girls away from the knowledge of the goings on in the shop. Their interest is kept occupied by the clothes they wear, the jewellery or the flowers they don. This of course occupies a prominent place because of the shop's insistence that women come dressed neat and clean to the shops. While one girl's desire to earn is spurred on by her observation in the shops of how others of her class come to work, another says, why should we know what goes on inside the shops as long as we get the raw material and wages.

Women's Options and Choices of Survival

The opportunities for women in beedi rolling exist in both the company and commission shops. In the company shops women have to demonstrate their skill in rolling beedis as required by their shop. Only when the managers are satisfied, the women are taken on the rolls. However, many of the women choose to roll for the commission shops, despite realising that they lose out on benefits like provident fund deposits, bonus and leave wages. They are even prepared to give extra bundles as podu vandal and often they may themselves have to make up for the shortage of the raw material supplied by the shops. There are two sets of reasons which can be identified to explain the choices women make. The first set of explanations lies in the women's place within the families and their social roles. The second set of explanations is in the socio-economic positions of these women's families and the centrality of beedi work for their economic survival. The combination of both these factors constitutes the rationale behind these choices.

Women preferred to roll for these commission shops because of certain advantages they gained compared to the company shops such as, (a) flexibility: women can submit less beedis leaving the balance of raw material for longer periods, unlike other shops. Also regularity here is not a stricture. The shopwowner also issues more than 200gm of tobacco per person, if she is capable of rolling. (b) Timings are not strict and women can go late, but within the reporting hour which is a big concession. (c) They can loan beedis from others

in plenty which may compromise on quality, which is tolerated less in company shops.

Old women in families or those who live on their own roll for these shops, being unfit for hard strenuous labour or unable to satisfy the quality rolling for the company shops. Apart from them, in the commission shops are those who are still in the transitional stages of learning and stabilising within their families. First, there are those who are unskilled, having begun to roll late in life and who are still sharpening their skills in beedi rolling. Then, there are those who were recently married and have to change their place of residence. In the stop-gap period of obtaining a new company passbook, they choose to roll for the commission shop. Finally, those with young children to look after, who have to breast-feed along with managing household chores, prefer commission shops.

Table 2 shows the distribution of beedi workers, women as well as girls in Kallooram, rolling for the company and commission shops. All the women and girls either have passbooks, or are rolling jointly, or on a chittai in both types of shops. The women from the ACC1 households have an edge over the women from other economic categories in holding passbooks in company and commission shops, reflecting the benefits they gain in both their formal and informal relations with the shopowners. While 20.2 per cent of the ACC1 women are in the commission shops, the proportions are 18.6 per cent in SUPP, 16 per cent in SURV households, respectively. Thus, perhaps social contacts and personal relations have more to do with getting a passbook than economic power or need. Apart from holding passbooks in both the company and commission shops many women from the ACC1 and ACC2 households even roll on chittai to augment their incomes, seen in the 19 per cent and 11.4 per cent of women, respectively from these households. On the other hand, it is the need for economic survival that prompted women from support and survival households to roll on chittai, indicated by 15 per cent and 19.4 per cent women from these households, respectively. The struggle for survival also compels them to accept the arbitrariness of joint rolling in company shops, seen in the 14 per cent and 9.7 per cent women from SUPP and SURV households, respectively. In ACC2 households,a considerable proportion, i e, 22.8 per cent women roll jointly in company shops, and 11.4 per cent women roll on chittai in the commission shops. They compromise by rolling for these shops in these statuses because the women's priorities lie in helping their families in household trades and businesses, while also earning and accumulating from beedi work.

Changes and Continuities

Given that women enter the labour process as young girls and continue as long as they can, sometimes ending up as assistants to their daughters and daughters-in-law when their capacities for beedi work have reduced, they spend almost a lifetime in the beedi industry. Continuities and changes, therefore, are not difficult to observe. The major continuities are the constant pressures in their lives from the shops, their own families and the social situation in which they find themselves.

Pressures are kept up by the shops about timings of delivery, the quota and quality of beedi rolled. These tend to get reflected in the day-to-day activities of the women workers which form a tension-filled routine. These pressures at the shop level are important because they influence women workers' relationships at two levels, between women workers themselves and within the household. Selvamuthu who is widowed, rolls for the Kajah beedi company shop at Kalloorani and is a passbook holder for the past six years. However, she also works as a child nutrition worker (CNW) at the noon meal centre. She has good informal relations with the shopmen who allow her to give and submit the beedis either through her sister or the ayah, both of whom also assist her in beedi work, when she has to go for duty to another village. She herself is also a conscientious worker. On the day of the village festival, she sat up till 2 am to finish 37 bundles, but still fell short of 13 bundles for the morning, since she also had to go for work to Ramachandrapatnam the next day. She says, "I cannot also give up the passbook because of the provident fund amount." Being widowed with two young sons, she needs every rupee she earns. On this count as we shall see later, Selvamuthu's as well as other's lives, are governed by the clock where every minute counts to roll, deliver and give account of the beedis. In other instances, girls wake up in the middle of the night to finish their beedi work which was halted on account of power cut, just so that they could settle the account the next day and not leave any pending submission.

While the shops exert their pressure on women, families have their own demands. The richer families direct their girls and younger women to save for the dowry, while in the less advantaged households the family demands that the money the girls earn is usually given to the family kitty. From that they can take and buy if necessary, soap, oil, hair clips, ear drops, powder, bindi, etc, but they were not to waste it and the girls complied. Added to this, relations and loyalties which evolve within the social circle exert their own constraints. If a commission shop has sufficiently established itself in an area, workers from within its catchment area find it difficult, having spent sufficient time and skills in this shop, to move out of it to a company shop, especially due to informal relations and loyalties built up over the years.

However, various discontinuities or breaks also mark women's beedi rolling trajectories. Many women are forced by social and economic circumstances to opt for beedi work and away from occupations such as agricultural labour. They find beedi work a hard compromise and do not gain as much as those who begin rolling when young. As Maniammal a former agricultural labourer who has had to do beedi work after her marriage says, "Before marriage I did not know beedi rolling, only for the past 19 years after marriage I have learnt it". Not being as skilled as the other women to progress to the company shop she continues in the commission shop. "Earlier, I used to do agricultural labour, where one works from 10 to 3 in the day and gets Rs 20-25. I prefer that, where one works hard, comes home to sleep well and won't fall ill. Beedi work makes one fall ill; one is often tempted to fall asleep, feeling dull and lethargic and don't want to go to the shop. When at the end of the week, we get our salary we feel ashamed as others get in 100s while we get in 10s."

Marriage marks the break with the beedi shop, if women have to move out into another village. Then she either opts for a commission shop or seeks a passbook in the company shop depending on her circumstances. Once in a company shop, she continues for many years till she wants to give up rolling or shifts to another shop, until which time her provident fund amount gets deposited and depending upon the level of arbitrariness, she gets her bonus and leave wages.

The next shift occurs at childbirth when women's energies are chiefly directed towards the care of young children. Women are forced to roll less if they have a company passbook or give it up and opt for a commission shop passbook. In survival and support households, where they might not even have assistance they are

forced to give up. Women who are well into their middle age and have teenage daughters to assist, roll for a multiplicity of shops. They will possess a passbook with one of the younger girls rolling jointly with them, while another daughter will possess another passbook in another shop. Such women are well on their way to accumulation through beedi work.

INTERACTION WITH OTHER WOMEN WORKERS

We have seen earlier that the industry indulges in various arbitrary practices that not only maintains control over the workers but also heightens their exploitation. What is significant is how women with the ingenuity use several coping strategies to retain their new found advantage of having a job. At one level are the choices women make for themselves to consolidate their position in the labour force. Another means of survival within this stressful situation was by evolving differing working relations with the other women workers. Efforts at unionisation also form part of these coping strategies. As beedi workers, women's interaction with other women form a vital part of their relations of production.

An important feature of daily beedi work is that most women cannot roll all of the 1,000 beedis in varying bundled forms themselves. Every woman borrows at least half of the beedis from three to four other women. Women pick up the beedis en route to the shop themselves or send children to retrieve the lent beedis. The woman rolling for the morning account borrows from the afternoon account person, and after returning from the shop has to sit down immediately to roll for the afternoon person. This takes place across socio-economic categories. Besides this mandatory loan and receipt of beedis, there are many other phases of beedi production where women interact between themselves. While some features bring women together, most others divide them apart. In some, women themselves take on an exploitative role.

Within the community itself women sublet the various tasks of the beedi production amongst their own family members or even to outsiders such as old women or handicapped women who have a need to have some earnings to survive. Workers juggle around their submission of beedis for the various shops depending on their experience and skill in rolling for a multiplicity of shops. Pappa, who is widowed and has two daughters, aged 13 and 11 has three passbooks. She rolls for King Beedi company shop, with her sister Rajamani as a joint worker along with her daughters. Pappa has also been smart enough to own another pass book at the newly-opened Kajah beedi company shop at Malayaramapuram where she rolls for 200 gms, without the knowledge of the shopowners, since one cannot roll for two company shops simultaneously. Further she also makes her younger daughter roll for a commission shop and chips her own bit for the girl to submit. Not all women however are able to do this and this keeps women divided in a way.

The quantities women produce or the number of shops they work for depends on each person's situation within the household. Thus, women-headed households which also are able to get help from younger girls, are sometimes able to accumulate unlike other households. Others who are not able to roll for a multiplicity of shops due to the pressure household work, feel remorseful or envious of those who can manage this. Their personal constraints become the source of division between them and not the wages or conditions of work. In their borrowing and lending interaction with other women their relations are not always smooth. The strictures put on them at the beedi shop as to the size and quality of the beedis, and its freshness are also the criteria used by them for each other, as quality will be forfeited when work is split between differentially skilled persons. So women's choice of two or more people from whom they can borrow is settled only after much trial and error, and risk of rebuke from the shopmen.

Another feature evolving out of this borrowing and lending interaction which is quite detrimental to the women is a phenomenon called 'vatti' (interest) beedi. Certain women who often belong to the well-off households are able to produce and circulate excess beedis and they loan beedis to those who need them on interest When sudden emergencies occur or work pressure at home increases, or when women are unable to fulfil their quota of beedi rolling for the day, they are compelled to borrow beedis on interest. Irregular beedi rollers are frequent borrowers of beedis on interest. If 10 bundles are borrowed they have to be returned with an interest of 1 to 2 or even 10 bundles with each passing day. A woman takes a tremendous risk by borrowing beedis thus, as the interest on the loaned beedis keep accumulating. Extreme examples abound where girls have sold off their ornaments to pay off the accumulated interest, with some even committing suicide being unable to repay the interest.

As a matter of fact, almost every woman has had to borrow 'vatti' beedi at one time or another, but Selvamuthu spoke of how her neighbour, Ponnammal, being an irregular roller and quite irresponsible too, often took 'vatti' beedi and was forced to sell her jewels. This phenomenon of interest beedi is looked upon by the women especially those at the receiving end, with distaste and fear. Distaste, because it works to the advantage of those women who can roll in excess and at the expense of the vulnerable and most pressured women in other less advantaged groups. And fear because they never know the moment when they would be compelled to loan the vatti (interest) beedis for themselves. Some of those who deal in vatti beedis also keep small amounts of loose beedi leaves and dust to sell, taking advantage of women's need to substitute the poor quality of raw material given at the shop and their inability to rush to the main hamlet to buy leaves and dust. They are many little shops in the main hamlet of Pavoorchatram, where retailers sell beedi leaves and tobacco dust of various flavours or degrees. These shops exist and flourish because the beedi shops, mainly the commission shops, indulge in the practice of supplying poor quality raw material Another innovative practice evolved by the women to meet impending crisis was the beedi-chit. Groups of ten or more women, usually neighbours, most often those rolling for a similar type of shop, which means having the ability to roll similar type of beedis,come together. Each rolling a bundle extra and picking lots as to whom the sets of bundles pooled that day would go to, was the method by which the chit fund worked. It resembles a co-operative effort if all women rolled conscientiously, in a manner similar to that of pooling money saved and offering it to the members of the group on a lottery basis.

Despite the beedi work being home-based and women separated from one another due to the individual responsibilities of their homes, they do it and work in small groups within or outside the homes. This seating arrangement of course depends on the seasons too. During the windy season in March and the rainy months of June-July and October-November women have to keep indoors, as the tobacco flies off their trays due to the wind outdoors. During summers women usually sit outside their homes under the shade of the neem trees Not only do women sit and work together because it is natural for them to come together and work in a rural milieu, but as most of them admitted they feel lethargic and are often tempted to go

to sleep when left to themselves. Many women, however keep away from group work and the risks of quarrels and prefer to stay within the threshold of their homes and work on their own.

Even though women may work in small groups the cohesiveness that exists amongst them is very fragile. While working they are always exchanging views with one another and their conversation more often than not becomes abusive or quarrelsome. Familial strife or disputes interfere with their work camaraderie and the exchange sometimes become extremely abusive and divisive. Where cohesiveness persists amongst the women, they exchange information about themselves, events in the village and its people. Often, some women spice these with raunchy jokes and gossip that keep them entertained. Children, especially young girls and even boys at times, if they have dropped out of school, are an important component of these groups. Intermingling with this fragile cohesiveness is a palpable rivalry amongst the women. A majority of the women said that beedi work did not create any unity amongst them, only jealousy. Their refrain was: "in this village, women due to their jealousy will not allow the other to prosper". As we have seen earlier, many of them work hard to earn and often force their teenage daughters to roll as well. The degree of their strictness or leniency varies. Many of them served as models or ideals of accumulation whom others tried to emulate while also feeling envious about their abilities. The adjustment and adaptive processes created by the women deprive them of bargaining power and unity against the employer. Instead, their tensions and pressures of work get transformed into anger against each other or envy and resentment. Only a few retain friendly relations while continuing to loan and buy beedis and raw material.

Briefly then, as the workplace enters the homes, where each woman is literally on her own managing the work of her household as well as her beedi work, it generates a situation where women are isolated in their struggle for survival. The resentment, the jealousy and the unsympathetic attitudes that these atomised conditions generate get reflected in the shop-level relations which work against the women themselves. Our study demonstrates that in the beedi industry, where women are denied a common workplace and a knowledge of the totality of the production process, marketing and sales, they are at a definite disadvantage. Not aware of the real reasons for which certain terms and conditions are imposed on them, they try to compete with each other while they are perpetually depending on each other as well. The result is that their own labour process exercises divisiveness. The interactions between women evolve out of the requirements of an atomised home-based production process which undermines the possibility of women understanding their own exploitation. Thus, the wrath that should be directed against their exploiters gets dissipated and distributed over the mass of fellow workers. The range of survival mechanisms that women evolve within the labour process consists of choices in opting for the different shops within their social contexts and familial roles, and handling the varying pressures from the industry, their household circumstances and their social milieu. It also includes the interaction women evolve with other women workers and the contradictory results it produces.

Women, on account of their gender have an isolated position in the industry despite their larger numbers. This inability to be visible and assertive as workers is an extension of their status within the household and community. The community's perception of women's labour is no different from that of the shopowners. Women are already in a subordinate relationship with their men within the household, and men's opinion of women's labour reflect the beedi industry's. Men place the onus of any trouble that takes place in the shops on women. Their support is to the shops, since the shopowners provide their women with work and a lever to survive or improve their living without upsetting the cultural matrix – a matrix that hardly gives women any power or voice, or a sense of being valued – nor does it let institutions like the union come up and assert itself. In such conditions industries like the beedi industry, that are home-based reap the advantages that accrue from divisiveness among women workers, the social perceptions of women's work and their prevailing low status in the community.

2 SOCO Trust, *Report of the Commission on the Survey of Beedi Manufacturing in Tirunelveli District*, Tamil Nadu, Commission appointed by the Supreme Court, Madurai, 1990.

3 'The households in the community were categorised into ACC1, ACC2, SUPP and SURV on the basis of the relationship of the beedi work of women in the household to the occupations of the other members of the household. The occupation in the village were grouped as those doing (1) agriculture and big businesses (2) small trades and petty businesses (3) general and agricultural labour.

In households with group (1) occupations, which were termed ACC1, the beedi work of women helped accumulate incomes. In households with group (2) occupations, which were termed ACC2, the beedi work of women also accumulated incomes, while in households with group (3) occupations, called SUPP, the beedi work of women supported the others' incomes. Apart from these three categories, a 4th category called SURV had only women beedi workers as the sole earning members in the household, on whose incomes the households survived. Those households which had no beedi workers were termed as NOBD.

4 The women workers mentioned (here and henceforth in the text) represent extensive case reports of women workers amongst various household categories in Kalloorani village.

Marginalisation of Women Workers

Leather Tanning Industry in Tamil Nadu

Millie Nihila

While liberalisation may have increased employment, it has worsened the quality of employment, especially for women. The article studies macro-level data to analyse employment of men and women. Data collection by official agencies uses faulty processes and much of women's work remains invisible. A macro-level field study of the leather tanning industry in Tamil Nadu shows that gender subordination is built into the system. Employment generation does not necessarily translate into a better deal for labour, especially women.

THE poor visibility of women's work (waged and non-waged) is well known and by now fairly well documented. Despite the problems and biases associated with the collection of data by the national level data collecting agencies, namely, the Census and the National Sample Survey, the work participation rate for women workers has been increasing both at the all-India and regional levels, in this case in Tamil Nadu. The modest aim of this article is twofold; one, using the data on employment collected by the macro-level data collecting agencies, we hope to analyse the nature and quality of the increasing employment opportunities that are supposed to result from economic and trade liberalisation in India, particularly since 1991. Two, we hope to (concretely) highlight how gender inequality is built into the very structure of the organisation of the economy, using the insights gained from a field-based study of leather tanning industry in Tamil Nadu. The central argument of the article is that, given the existing structural nature of employment in the economy, increases in employment generation does not necessarily translate into a better deal for labour, especially for women.

In Section I we give a brief overview of the employment of men and women using secondary sources. Section II is based on our field study; it not only unravels the faulty process of data recorded by official agencies, but goes beyond to show how this 'officially sanctioned' faulty process has become a weapon or tool in the hands of employers and trade unions to 'legitimately' subordinate women workers. Section III concludes.

I
Macro View of Employment

The study of women's work is and continues to be of crucial importance, for it helps to identify the processes and structures which generate gender inequalities, gender segregation and gender subordination. Making visible these processes would also help us to devise policies to combat to some extent the adverse conditions and situations in which women work.[1]

Since independence the work participation rate (WPR) for women workers has been increasing both at the all-India and Tamil Nadu level.[2] The WPR for females in Tamil Nadu is much higher than that for India (Table 1). Within Tamil Nadu as revealed in Table 2 the percentage of male workers in rural areas has been falling over time; at the same time the percentages of female workers has been increasing both in rural and urban areas.

Much of what women do is not entirely covered in the existing definitions and methods used to measure WPR [Swaminathan 1997]. The first level of marginalisation/making invisible women's work begins with the manner in which workers are classified into principal/subsidiary categories by the NSS and main/marginal workers by the Census. Table 3 reveals that, for female workers in rural areas, there is 6 per cent increase in work participation rate for women when marginal or subsidiary workers are taken into account along with main workers, in both Census and NSS reports. On the contrary when main and marginal workers are included for calculating WPR for males there is hardly 1 per cent increase. This reveals that more systematic and careful data collection and more inclusive definition of economic activity might result in giving a much higher female work participation rate.[3]

We are aware that the way 'worker' is defined varies between NSS and Census Reports.[4] However our concern in this article is not with definitional problems per se but more with the implications for gender of the continued usage of these definitions.

An almost unchanging feature of the structure of employment in the Indian economy is that more than 90 per cent of workers (male and female) are in the unorganised sector. While agriculture is almost unorganised, of the total employment in the non-agricultural sector, only 30 per cent of workers are in the organised sector. Even in the urban areas, over three-fourths of employment is in the informal sector [Dev 1997]. Available data [CMIE 1994] show that only 10 per cent of the

total working population is engaged in the organised sector. The rate of growth of employment in the organised sector has been 1.8, 1.5 and 1.2 respectively for the years 1990, 1991 and 1992 implying therefore that the increase in the rate of growth of employment officially claimed has taken place in the informal sector [Nihila and Swaminathan 1995].

The vexed questions of what constitutes and/or how to define organised/unorganised sectors, formal/informal sectors, have been with us for quite some time. For the purpose of this article, the terms have been used as follows: organised/unorganised refer to the status of the units of production. Thus organised would broadly be coterminous with 'legally' constituted units while unorganised would be units set up 'illegally' in the sense of not being officially recorded and/or covered by any of the officially sanctioned bodies of the state. We have used the terms formal/informal to refer to the status of workers. Formal workers would be those officially recognised and recorded as workers and eligible for such benefits as their official recognition confers upon them. Informal workers on the other hand, have no legal recognition as workers; not being officially recorded as workers they have no official claim to the protective measures available to formal workers.

The purpose behind using different terminologies for units of production and workers is to highlight the fact that a legally constituted unit (organised according to our definition) does not necessarily employ only formal workers. While unorganised units (illegal units in our parlance) by definition work with only informal workers, what needs emphasis is that a large chunk of informal workers are employed by organised (legal) units. Of total women workers, the proportion working as informal workers in the organised and unorganised sectors is quite high.

The National Sample Survey has classified workers according to the mode of payment as self-employed and wage-employed. Waged work is further categorised into (i) regular/wage salaried and (ii) casual wage employment. (In the absence of any further information it is not possible to decipher what proportion of workers under the category [regular/wage salaried] are informal workers. Workers in the other two categories, namely, 'self-employed' and 'casual wage employment' generally belong to the informal sector). Self-employed are those for whom household work forms the major source of income.

What Table 4 highlights is the fact that in Tamil Nadu a greater proportion of the workforce (around 95 per cent in rural areas and around 70-75 per cent in urban areas) is either self-employed or casual. The regular salaried/wage labourer form only a small proportion of total workforce particularly in rural areas and more so in the case of rural females. Overall fall in the self-employed category and increase in casual wage employment also means increase in the concentration of workers in informal sector. Increase in casual wage employment labour category could be due to the expansion of the modern sector, particularly, export-oriented units which depend mostly on casual labour [Kalpagam 1994].

As Kundu (1997) says "It can be argued that the current system of subcontracting of work in the urban economy is such that the female workers are no longer reported in the self-employed category. They are getting work – whatever may be the wage rate or working conditions – on a more regular basis. This reflects a significant change in the organisation of work and emergence of a new subcontracting system in the urban informal sector."

The sex distribution of workers reveals that the proportion of women workers in casual wage employment is more than that of males.

Table 5 brings out the sectoral concentration of workers by sex and area of residence. The primary sector comprises of agriculture and allied activities; secondary sector comprises manufacturing, mining and quarrying, electricity, construction, etc; and tertiary sector comprises trade, transport and services. Primary sector is largely unorganised, whereas, secondary and tertiary sectors are partially organised and comprise non-farm activities.

In rural areas a majority of men and women work in the primary sector (that is, agriculture and allied activities). The primary sector in India is almost totally informal by nature of organisation. Even here, while there is a distinct declining trend for males over time, for females the proportion has remained almost the same, around 77 per cent. In secondary sector there is a marginal increase in the proportion of female workers, whereas in the case of rural tertiary workers there is a marginal fall. Over time it can be seen from Table 5 that more than 70 per cent of women are in the primary sector, which is informal by nature of organisation.

Within the secondary sector, manufacturing contributes more than 70 per cent of the employment. The other set of information [Economic Survey, Economic Appraised of Tamil Nadu] available to us on employment shows the extent of con-

centration of workers in various manufacturing activities. Whatever data we have reveal an increase in the percentage of informal workers in the organised component of the manufacturing sector since liberalisation.

With Indian liberalisation package came the drive to increase export earnings through increases in both the quantum of exports and value addition of the goods exported. Studies [Nihila 1995] show that 50 to 60 per cent of total export earnings are made up of commodities manufactured generally by small enterprises using informal labour. The items that dominate the Indian export basket include leather and leather goods, gems and jewellery, handicrafts and readymade garments.

A distinct feature of these export items is that they employ relatively large number of women workers. Our surmise therefore is that a part of the increase in employment officially claimed [quoted in Swaminathan 1995] would have taken place in the informal labour-intensive export industries, a direct consequence of which could be an increase in the employment of women.

Leather industry is one of the major export earning industries of India. It is the fourth largest item contributing 7 to 8 per cent of total exports (till 1995); it ranks first from the angle of foreign exchange earnings. In Tamil Nadu leather industry plays a pivotal role. Tamil Nadu exports 55 per cent of total leather exported from India while 70 per cent of hides and skins produced in the country are tanned and finished in Tamil Nadu [Nihila 1993]. This is one industry where women are not supposed to be technically employed, but official claims notwithstanding, large numbers of women are visibly employed, albeit as informal workers both in the organised and unorganised segments of this industry.

II
Micro Study of Employment

The macro picture of increasing but low status employment and of women is supplemented (in this section) with insights from a micro level study[5] of an export – oriented industry, namely, leather tanning industry of Tamil Nadu. Neither the increase in the quantum of export earnings from leather products nor the increasingly sophisticated techniques used in the production process have alleviated the appalling nature and conditions of employment in the tanning part of the leather industry. Further, through an assessment of the nature and quality of employment in the tanning industry, we hope to show how gender subordination, segregation and inequality is built into and maintained in this otherwise booming industry.

The quality of leather products is critically dependent on the quality of tanning, which part of the industry is the most polluting, the most hazardous, but the most labour-intensive component of the leather industry. Leather industry as such can be divided into three segments: leather tanning (raw to semi-finished stage); leather finishing (semi-finished to finished stage) and leather products industries. Each of these components has six to eight processes. Tanning is basically converting animal hides or skins into leather. The basic raw materials used in tanning are skins (outer covering of sheep and goat) and hides (outer covering of cow, buffaloes and calf). The methods of tanning generally followed are vegetable tanning (this is called as EI or East India tanning) and chrome tanning.

The leather tanning industry has been designated as 'hazardous industry' under the Factories Act, 1948. Among the different operations, liming and tanning of raw hides and skins and processes incidental thereto have been notified as dangerous operations by Tamil Nadu Factories Rules, 1950. Schedule 9 of Chapter IX. Section 84-A of the Act (Tamil Nadu Factories Rules) deals with matters relating to exemption of women workers from certain operations. Under this provision, women workers are exempted from working in country (EI) and chrome tanning excluding finishing units.[6] This is a high-risk industry as far as workers are concerned.

Our survey and interviews with experts in the leather industry revealed that nearly 225 chemicals are used in the various processes from tanning to finished leather. Of these 225, quite a few chemicals are toxic. Studies [Rutherford 1948; ILO 1974; NIOSH 1976; Proctor and Hughes 1978; Decoufle 1979; Roberts 1983; GoI 1984; Subramaniam 1988; Rajan 1990: Nandkumar and Backiyavathi 1990; Sunil 1991 PRIA; IARC and WHO 1981] have disclosed that prolonged contact with

chemicals used in leather industry leads to dermatitis, conjunctivitis, nervous disorder, itching of skin, throat, mucous membrane, chest pain, ulcer, breathing problem, asthma, bronchitis, fissure in fingers, toes, mouth and nose; frequent fever, headache, stomach upset, etc. Some of these chemicals if inhaled can become fatal. National Institute of Occupational Safety and Health, US (1976), has noted that the accident and illness rate is five times higher in tanneries than the average for all other industries

It has also been estimated that on an average each year, one in five tannery workers is a victim of work-related injury. Hazards have increased with the increase in the intensity of chemicals used, and despite the improvements in the technologies used in the production processes. The brunt of these hazards is borne by workers, more often by women workers. Specific gynaecological problems faced by women workers are: menstrual disorders, premature deaths, still births, prolapse of uterus, etc. This is one industry where increasing (exports) production is accompanied by increasing risk to workers.

A brief idea of the manner in which the leather industry is structured - organisationally and in terms of the labour that it employs – is necessary to bring out why the subordinate status of the tannery workers (particularly women) is systemic and not just a problem that can be resolved by implementation of existing factory and/or social welfare legislation We begin with the manner in which units are set up in the industry.

The setting up of any unit or process of production in leather tanning industry requires formal approval, for tanning has been designated as a particularly hazardous industry In practice, however, there are any number of units in Dindigul that have commenced production without formal sanction; apart from this, existing (legal) units have added on additional processes without formal approval. These illegal units and/or illegally expanded parts/processes of legal units employ large numbers of labour particularly women. Strictly, as per the Factories Act, 1948, women and children are prohibited from being employed in the leather tanning industry. But the industry has not only managed to circumvent the provisions of Factories Act, 1948, but also has, over the years developed and expanded without formal sanction and without expending much on its labour. Much of the expansion of the industry being illegal, there is no way in which the workers recruited in this system can claim legal protection. The bulk of these illegal workers are women and of the dalit caste. From our visit to various tanning pockets of Tamil Nadu, we have estimated that almost 30 per cent of the total tannery workforce is female. And all of these women are informal workers. Despite the stringent requirement of a formal licence, the industry has managed to expand illegally both in terms of production and labour employed.

Our stress on legality is because of the severe adverse implications it has for labour in these units. The non-legal status of most of the units coupled with the non-legal status of the workers employed in them has led to a situation where there is no authentic record of the existence of these workers. This in turn means that it becomes extremely difficult to claim any benefit under any of the welfare schemes – local, state or central – that may have been instituted to help such workers.

An added dimension to this problem of non-recognition as workers is the manner in which women labour in particular are recruited. Almost all women workers are brought into the industry through contractors. Technically, therefore, the employer is not answerable to these women workers. Worse, it is very often the contractors who are on the payrolls of the employers rather than the workers actually working for the unit. An important implication of this mode of recruitment into the industry is that even in the case of legal units, the women workers could be rendered nonexistent if they are recruited through contractors Either way, whether in legally constituted or in illegally set up units, large number of women, who have been working in this industry for years, have been doing so without the most basic of a worker's right, namely, being recorded as a legitimate worker. Our field survey revealed that all women in Dindigul are recruited through contractors.

Further, when women workers are recruited through contractors, the status of their employment (that is, temporary or casual), conditions of employment, wages, etc, are negotiated by the contractors on behalf of the women workers. A fallout of this mode of employment through contr :tors is that:

(1) The employer is not under any obligation to contribute to measures such as ESIS, Provident Fund, etc. Nor does the contractor negotiate for any of these benefits on the womens' behalf.
(2) The women cannot demand any kind of personal protection. They use discarded car tyres as boots; plastic sheets are used to cover waist; gloves discarded by male tannery workers are passed on to women after being overused, which is the same as to not wearing a glove. There is no separate toilet or restroom for women workers in any of the tanneries visited by us.
(3) Their working hours are neither regular nor do employers follow the eight hours work-day schedule.
(4) Women workers are paid only consolidated amount as wages. When they do extra work or overtime, the wage for the same are calculated only on the basis of regular work, which means no additional wage is paid for them. But, overtime work is compulsory; and the women workers are not always informed in advance about overtime work.
(5) As far as the physical work area is concerned, women workers are sometimes made to work under the direct heat of the sun.

The recruitment of women workers through contractors and the consequent invisibility presence of these workers in the units in which they are employed, frees the owners of units from a whole host of obligations while gaining several benefits.

Since most women are employed in 'illegal' operations, they and their activities are not officially recorded. But unless these initial tanning operations are performed, the later processes of tanning cannot even begin. If at all women get recorded it is only as helpers or coolies. Not only do these terms not capture the entire range of activities performed by women workers, but what is worse, the designation as 'helper' or 'coolie' enables the officials, employers and trade unions to label these tasks as unskilled and the workers as casual labourers. All these lead not only to an official undercount of the actual number of women employed in tanneries; but worse official recognition of the hazardous conditions in which the workers especially women operate is also to that extent denied. Based on our field survey we give below an idea of the several different tasks (physically strenuous and mechanically debilitating) performed by women workers otherwise termed as helpers or coolies.

(A) *Skin tanning units*: In the skin tanning units, women are employed in the initial process of opening the (raw) curried skin which is followed by trimming and sorting of the same. These operations are mostly done by chuckliyar women – the caste traditionally associated with leather work-

ers. Of the workers employed in this process 60 per cent are women.

In the pre-tanning stage (beam house) women are engaged in operations like cleaning the lime pit (that is, cleaning of sludge, and pickling of waste, flesh, etc. with lime sludge), cleaning the beam house, and other processes related to hair. Apart from these above mentioned operations women workers also do other miscellaneous jobs like carrying pelt[7] from one place of process to another, pailing it up, etc. Of the women interviewed 58 per cent were engaged in this process.

In the tanning stage, especially in North Arcot and Tiruchirapalli tanning pockets, women help machine operators by holding the pelt while it is being fed into machine. Holding, carrying to and fro these huge heavy pelts is strenuous and back breaking. Around 30 per cent of women workers we interviewed are in the tanning processes.

Both in tanning and post-tanning stages, women workers are involved in drying process. These operations pose severe hazards to women workers especially during winter and rainy seasons. During these seasons, skins are dried in dark chambers with heat being generated through charcoal fires. Women workers have to walk across burning charcoal to hook and unhook skins. It is not only suffocating, but the incidence of women workers getting their feet and clothes burnt is quite high. The other operation, dyeing, is done by women workers with the help of hand sprays. Most of the chemicals used in dyeing are toxic but which the workers have necessarily to inhale and endure. Though only 12 per cent of workers were involved in this process, of the total workers employed in this process women constitute 65-70 per cent and rest are adolescent males.

In the finishing stage, women workers are involved in drying and dyeing of skins (both of these processes are extremely hazardous) and also in sorting, measuring and packing. Women from all communities work here. Of the women we interviewed 5 per cent were in this process.

(B) *Hide tanning units*: In the hide tanning processes women are recruited for cleaning bark-pits, carrying water: breaking nuts and crushing barks, drying the used nuts and barks; to fold hides and are also made to assist semi-skilled (knifemen) workers. While folding they have to wring the hides to make the hides wrinkle-free. In North Arcot tanning pockets, women are recruited for wringing and folding huge hides. This is done by women in a group of four. This is a tedious and laborious job. The large size and heaviness of the hides makes it strenuous.

CHART 1: EMPLOYMENT BREAK-UP OF TANNERY PERSONNEL

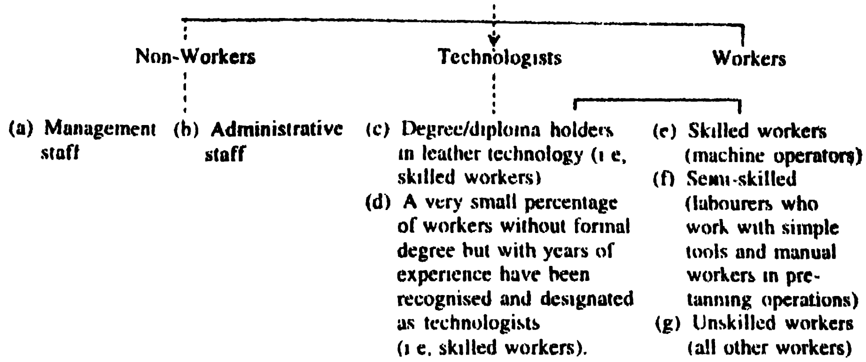

CHART 1(A): EMPLOYMENT STATUS OF TANNERY PERSONNEL

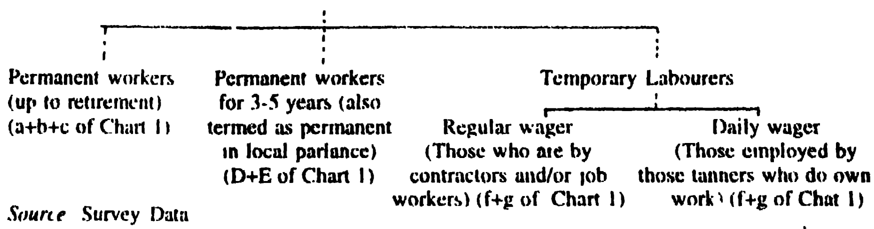

Source Survey Data

In addition to the tasks in the above processes women workers are also employed as sweepers, scavengers and cleaners. Each of these tasks involves an enormous amount of work, much than terms like cleaning, helping, assisting can convey. Practically all operations in which women are engaged are not only time consuming and back-breaking but also ones which cannot be mechanised.

The tenure and status of employment of workers is another tool in the hands of employers, contractors and (male) trade unionists to relegate women workers to a subordinate position. We give an idea of the overall employment structure in the tanning industry in order to make our argument of the subordinate status of women workers clear.

Staff in any tannery can be divided into three categories, namely, non-workers, technologists and workers (Flow Chart 1). Not all persons employed in any tannery are made permanent. Permanent till retirement in tanneries applies only to non-workers (that is, management and administrative staff). Workers are made permanent, but not till retirement. This privilege of (temporary) permanency, is available only for male workers. Here too they are made permanent only when they work for 240 days without break.[8] Once made permanent, they are entitled to all allowances and benefits, like ESI, periodical medical check-up, etc. But within five years they could be thrown out of the job. The firm in which these workers are employed may close the unit and retrench them, reasons usually given for closure are change in management, declaring false bankruptcy, labour problem, non-availability of raw materials and/or inputs, etc. The third category of temporary labourers are those who always remain in the temporary category. There are two categories of temporary labourers, regular and daily. The difference between regular and daily lies in the fact that regular (temporary) workers are assured of jobs and salary while daily (temporary) workers have no such guarantee. (Chart 1 and 1(a) give an idea of the staffing of tanneries with the respective employment status). The temporary (regular and daily) labourers are not entitled to any allowance and/or social benefits. Of the women interviewed by us, none was in the permanent category – either lifetime or the five-year permanent category. Nearly 90 per cent of the women workers belonged to the temporary – daily category.

Only those workers designated as skilled can become permanent (three-five years assured employment). The industry, as it is presently organised, precludes women workers from being designated as 'skilled' or even 'semi-skilled'. This bring us to the manner in which 'skill' as a term is used and operationalised in Dindigul.

Skill as defined by tanners is based on the processes in which workers are involved. Mostly, those who operate machines (only males) are called skilled workers. Semi-skilled workers are those

who use simple hand tools for work, e g, knifeman who does unhairing and/or defleshing. All other categories of workers are unskilled workers.

Based on the informations gathered during our field work, and using Charts 1 and 1(a) the following Charts 2 and 2(a) have been worked out. These charts depict the categories of tannery workers (in percentages) by their respective skill and employment status.

Machine work is given exclusively to male workers and never to women workers. The reasons given for not employing women on machines include: (a) Women are considered to be less capable of using machine despite the fact that it is merely feeding skin to the machine.[9] (b) The Factories Act, 1948, does not allow women to work in or near any moving machine. The Factories Act, 1948, however has not come in the way of recruiting larger numbers of women in other polluting tasks associated with tanning compared with the relatively less arduous tasks associated with machine operations. The women themselves realise that the employers in collusion with the male trade unions are keeping them out of the mechanised and high paying jobs by invoking the Factories Act, 1948. The contract nature of women's recruitment does not give them any leverage to bargain for a better status and therefore better conditions of employment.

The process of recruitment (through contractors), the nature of employment (temporary or casual), designation of women workers as helpers, coolie, assistants, etc, combine to disempower women even when in wage work. After years of working in different tasks associated with the tanning industry, women find themselves moving only horizontally. Men, on the other hand, whatever be their mode of recruitment, are able to move up vertically and in the process change their status from unskilled to semi-skilled to skilled over time. It is nobody's contention that men workers in the leather industry have it easy. The point being stressed however is the stark discrimination by sex actively practised in Dindigul.

III
Conclusion

We began with an analysis of the picture presented by macro-level data on the nature of women's work. That data revealed an increasing trend over time in terms of numbers of women employed particularly in the secondary sector. However, it also simultaneously revealed the fact that much of the increase has been in the categories of 'self-employed' and 'casual temporary'. There has also been an official hype about increasing employment having been generated in the post-reform period (that is, after 1991). Whatever data we have been able to collect show that the quality of the employment generated has deteriorated. Our micro level study based on an analysis of data collected in the leather tanning industry has revealed how gender subordination is built into the system such that merely tinkering with the Factories Act or labour related social welfare legislation will in no way change the macro picture of abysmal quality employment. Fundamental changes at the micro level are needed.

Notes

[This is a revised version of the article presented at the workshop on 'Women's Occupational and Reproductive Health: Research Evidences and Methodologies', held at the Tata Institute of Social Sciences, Mumbai, February 23-25, 1998.]

1 Kalpagam (1994) in her study has explored and vividly brought out how the market persistently works against women.

2 Though initially we were aiming to bring out the trend of work participation rate of women workers since independence, we could not succeed in our endeavour due to non-availability of information on WPR of women. However, we have put together information from *Census of India Report* of 1961, 1971, 1981 and 1991 and various rounds of *National Sample Survey, Quinquennial Survey on Employment and Unemployment in India* – 27th round (1972-73); 32nd round (1977-78); 38th round (1983); 43rd round (1987-88); and 50th round (1993-94).

3 The workforce participation rate refers to the number of persons/person days employed per thousand persons/person days. NSS classifies workers based on status: initially it classifies a person either as 'worker or employed' or 'seeking/available for work or unemployed'. Later the time spent criterion is used to categorise a person as 'principal status worker' or 'subsidiary status worker'. If a person is engaged in economic activities for relatively longer period of time in the preceding 365 days from the date of survey, s/he is considered a 'principal status worker'. A person categorised as a non-worker who pursued some economic activity in a subsidiary capacity is called a 'subsidiary status worker'. These two groups viz, principal and subsidiary status workers together constitute the category of 'all workers'.

Census classifies workers into main and marginal workers. Those who had work for major part of the year are termed main workers, by major part of the year is meant six months (183 days) or more. Those who had not worked for the major part of the year, that is, their work is less than six months (183 days) in the year are termed marginal workers.

4 The recording of women as workers in the Census Reports as well as the NSS suffers from serious enumeration and reporting drawbacks. According to Mitra (Mitra, Ashok (1981), quoted in *Shramshakti*, p 27), '. the under reporting of female work participation rate in census varies from 30 to 40 per cent. He estimates that the participation of females in the informal sector is as high as 49 per cent as against 15 to 17 per cent in case of males'.

Jain and Chand (Jain, Devaki and Malini Chand (1982), quoted in *Shramshakti*, p 27) find that '.. the measurement of female labour force participation and analysis suffer from gross underenumeration – inadequate attention to unpaid family labour, own production and household work and relationship between them.... These are poor conceptualisations of female work style, mistaken perception of female economic roles by respondents and interviewers'. Whatever has been reported by published information on work participation would help one to know the trend and intensity of work participation of women, which would serve as a base for further discussion.

5 Our paper is based on the survey conducted in leather tanning pockets of Tamil Nadu, namely, Dindigul, Trichirapalli, Vanniyambadi, Ambur and Pernampet. We did a census survey of all leather tanning units in Dindigul. A second round of survey was conducted for leather tannery workers in Dindigul, Trichirapalli and North Arcot (Vanniyambadi Ambur and Pernampet). Our survey was conducted between 1991 and 1993.

Details of workers interviewed:

	Males	Females	Total
Dindigul	41	65	106
Trichirapalli	18	41	59
North	0	33	33
Total	139	59	198

6 Dangerous occupations according to Sec 87 is where the (state) government is of the opinion that any manufacturing process or operation carried on in a factory, exposes any person employed in it to a risk of bodily injury, poisoning or disease. The state may make rules applicable to any factory or class or description of factories in which manufacturing process or operation is carried on. Sec 87 (b) prohibits or restricts the employment of women, adolescents or children in the manufacturing process or operations. According to the Annual Report of the Factories Act of Tamil Nadu, 1979, it was found that 92 per cent of workers are employed in dangerous operations in the leather industry.

7 Once the hair and flesh are removed from skin/hide, the remaining substance is called pelt.

8 Though it is a necessary condition to work for 240 days without break to become permanent, continuous working becomes impossible in case of many workers because (i) job is not available continuously and (ii) available jobs are so strenuous that workers fall sick very often leading to a break in service.

9 All machines used in the process of tanning are built on a simple model, like two rollers which needs to be operated with a paddle. What needs to be emphasised here is that there is nothing so complicated about these machines which will be difficult for women to operate.

Violence against Women
Wife Battering in Chennai

Subadra

Domestic violence, more often than not, is rooted in patriarchal notions of ownership over women's bodies sexuality, labour reproductive rights, mobility and levels of autonomy. The phenomenon of wife battering is shrouded in myths and stereotypes that need to be debunked. A study in Chennai located in the context of the rising curve of crimes against women in the city.

DEVELOPMENT is about protection of human rights of the concerned populations. It pre-supposes active participation of the populace in the decision-making processes while social justice remains one of the most important and cherished goals of development. However, contradictions do remain as a result of various processes not only among nations at a global level, but also significantly within sections of population within a country. People continue to be marginalised on the basis of class, religion, ethnicity, colour, sex and in India specially, on the basis of caste. Discrimination and exploitation on the basis of gender constitutes a serious issue which effectively means that half the human race is unable to realise its potential and condemned to sub-optimal standards of existence. This problem has received worldwide attention and several efforts have been made to bridge the seemingly ever-widening gap. Yet even after years of efforts to integrate women into the mainstream development processes, the effectivity of the same remains to be questioned owing to a multitude of factors which aid the continued marginalisation of women. Women's access to education, health, employment and political spaces still remain distant goals in many nations of the world. One of the most serious impediments to women's development is the phenomenon of continuing and increasing violence against them. Needless to say, this constitutes a serious violation of women's human rights. Violence against women is one of the most significant, yet little understood and acknowledged factor instrumental in the phenomenon of marginalisation of women in the development processes. Gender violence manifests itself in various forms – female foeticide and infanticide, sexual abuse, incest, molestation, sexual harassment at work and on the streets, marital rape, domestic violence in the form of wife assault and woman battering. In some places, there exist culture-specific forms of violence against women like female genital mutilation in some African countries and harassment/murder/beating for dowry in India. Of all the forms of violence that women face, domestic violence remains the least reported and largely suppressed.

For women, violence is a phenomenon which starts at conception and carries on through their entire life span. In India, pre-birth selection and consequent infanticide is a common occurrence and the preference for a male offspring widespread. Discrimination continues by way of access to adequate food, prompt medical facilities, burden of housework, care of siblings and so on leading to lack of education and consequent lack of awareness and empowerment and imparting of skills. Adolescence brings with it the complete withdrawal of the little freedom of mobility, fear of and occurrence of sexual assaults; both within and outside of the family. Vulnerability is further compounded by early marriages and early child bearing and the disastrous consequences of the same on the health of women. In India specifically, child marriages further accentuate the girl's vulnerability. The reproductive age is, for a lot of women, punctuated with physical, mental and emotional abuse by their husbands. Millions of Indian women face severe harassment due to unfulfilled dowry demands and many are victims of homicide and are even driven to suicide. All these foster a deep and inescapable sense of dependency in women who are left with no alternative but to continue to live with/depend on abusive partners for want of any other choice. Additionally, women constantly need to negotiate their space and contend with abuse at the workplace too. An important fact is that a woman may experience violence either once in one of her life-cycle phases or be continually exposed to multiple instances of violence at various points in time. It has, however been established beyond doubt that wife-battering is probably one of the most endemic forms of violence against women throughout the world.

Domestic violence arises from patriarchal notions of ownership over women's bodies, sexuality, labour, reproductive rights, mobility, and level of autonomy. Deep rooted ideas about male superiority enable men to freely exercise unlimited power over women's lives and effectively legitimises it too. Violence is thus a tool that men use constantly to control women as a result of highly internalised patriarchal conditioning which accords men the right to beat their wives and thus ostensibly perform the duty of chastising them. The unequal and hierarchical gender relations manifest itself clearly in the familial set-up and is accentuated by clear demarcation of sex roles and sexual division of labour. Violence within the home constitutes, more often than not, a 'private' affair because of the high value attached to family as an indisputably sacrosanct social institution. In fact, this belief disables rightful cognisance of the fact that more often than not, the family, in reality, is the site of and the root of unequal gender relations and oppression of women. This in fact, puts violence (which is systematically meted out to women within the family) above public scrutiny, thereby creating a public/private dichotomy with respect to violence against women. Not surprisingly, thus, marital violence, especially woman battering goes largely unnoticed or more importantly, hushed. It has also been quite apparent for a long time now that violence against women within the family does not constitute an occasional, rare incident, but is a regular systemic and structural manifestation of social control. One of the main causes for the non-recognition of wife battering as a serious social crime has been the fact that the phenomenon has been shrouded in myths and stereotypes which need to be debunked to enable an understanding of family violence. These range from viewing battered women as mentally disturbed or sick individuals, batterers as products of an abusive environment; and violence as a result of abuse of drug and alcohol.

Conceptual Framework

In the past few decades, with increasing evidence regarding the phenomenon, marital violence has drawn the attention

of several concerned feminists, human rights groups, social scientists and social work practitioners. Also, many scientists have since attempted to study the phenomenon and have proposed several theories to explain the same. An overview of the various theories that have been put forward follows.

According to Anjali Maydeo of Nari Samanta Manch, a Pune-based women's group, theories related to domestic violence can be grouped into three categories; psycho-analytical theories, social learning theories and the socio-political critique. Psycho-analytical theories are those that focus on the emotions/feelings instilled during child rearing which make women and men behave in a particular fashion. The social learning theories view violence as a direct consequence of socialisation processes and the family environments from which the women and men learn to be 'helpless' and 'aggressive' respectively. The socio-political critique highlight the role of patriarchy in the manifestations of violence which forces women into subordinate positions.

Two of the most often discussed theories on battered women are Lenore Walker's 'The Cycle Theory of Violence' and 'Psychosocial Theory of Learned Helplessness'.

The cycle theory of violence comprises three distinct phases in the cycle of violence – the tension building stage, the acute battering incident and kindness and contrite loving behaviour. In the first stage, when minor battering incidents occur, the woman adapts, rationalises and externalises the problem. Tension mounts in the second phase leading to the acute battering incident leading to severe repercussions on the woman – physically, emotionally and psychologically. Phase three is welcomed by both the partners which is marked by uncontrolled love, affection and promises by the husband never to repeat the incidents again. This cycle keeps repeating itself in the lives of almost all battered women. The psycho-social theory of learned helplessness focuses on the factors which reinforce battered women's victimisation. According to this theory, battered women operate from a premise of 'helplessness' which further serves to only aid passivity and a fatal acceptance of the exploitative situation.

As opposed to the cycle theory, E W Gondolf and E R Fisher proposed the survivor theory in 1988 which views women not merely as passive victims but proactive help-seekers and survivors. The assumptions of the survivor theory are in sharp contrast to the above theory of learned helplessness. The survivor theory credits women with the capacity to innovate newer strategies of coping and acknowledges the efforts of the survivors in seeking help from formal and informal sources. In addition, the survivor theory stresses the need for accessible and effective community resources for the woman to escape from the batterer. As mentioned earlier, the survivor theory takes cognisance of the multiple help-seeking behaviour of women in the face of increased violence. Further, it also lauds the 'female survivor instinct' which focuses on nurturing rather than destruction, the willingness to adapt and the efforts directed at furthering of self-growth.

Despite violence being the primary issue which brought the new women's movement in India in the early seventies, there have only been sporadic efforts at a theoretical understanding of the issues which confront women in India. Field level action and protests have, more often than not, occurred in the absence of a theoretical framework. However, significant theoretical initiatives have been put forward by Sharad Patil, Sharad Joshi and Vandana Shiva, pioneer intellectuals and activists associated with women's movements in the spheres of the anti-caste, the peasant and the ecology movements in India respectively. Gender relations, sexual domination, matriliny, etc, form an essential part of Patil's analyses of caste/class oppression. Traditional Marxist framework forms the basis of the analyses where patriarchal attitudes towards women's sexual freedom, power of sexuality seek to bind women culturally. In Joshi's view, patriarchal oppression is seen as arising out of accumulation of material and economic surplus and the concentration of the same in a few hands. When the imbalance is sought to be corrected, the processes result in the suppression, rape and slavery of women. western science and technology and the imperialist west are seen as the primary causes of women's exploitation in Shiva's view. This theory asserts women's positive relationship with nature (evident in the Chipko movement) similar to the Gandhian philosphy. Also, this approach views women not as mere victims but as powerful agents with the power to change the course of their lives.

Women's groups all over the world have continuously campaigned to draw public attention to the issue of gender violence. Unfortunately, an accurate estimate of the dimensions of the problem has been difficult to obtain because of the gross under-reporting of the phenomenon.

According to recent victimisation surveys in the US, only 2 per cent of intrafamilial child sexual abuse, 6 per cent of extrafamilial sexual abuse, and 5 to 8 per cent of adult sexual assault cases are reported to the police. By comparison, 61.5 per cent of robberies and 82.5 per cent of burglaries are reported [Koss 1990]. According to Lise Lachance in 1994, the following estimates emerged about the extent of violence against women in Canada:

– One-half of all Canadian women have experienced at least one incident of physical or sexual violence since the age of sixteen.
– One-in-four Canadian women can expect to be sexually assaulted in her life, half of them before the age of seventeen.
– From 1969 to 1987, the number of declared rapes increased by 125 per cent. Half of them were committed in the victim's houses.
– A study on women with disabilities found that almost half had been sexually abused as children, and one-in-four had been sexually assaulted as an adult.
– 80 per cent of women in federal prisons had previously suffered physical or sexual abuse.
– Six-in-ten Canadian women who walk alone in their own area after dark feel "very" or "somewhat" worried doing so.

TABLE 1: CRIMES AGAINST WOMEN – NAIONAL TRENDS (ACTUAL FIGURES)

Source: National Crime Records Bureau, Crime in India–1994, Government of India

– The World Bank estimates that rape and domestic violence account for 5 per cent of life lost to women of reproductive age in demographically developing countries. In developing countries such as China, where maternal mortality and poverty-related diseases are relatively under control, the healthy years of life lost due to rape and domestic violence again account for a larger share (16 per cent) of the total burden. In established market economies gender-based victimisation accounts for nearly one in five healthy years of life lost to women of age 15 to 44 [Heise 1994].

In India, there has been very little research done on the subject of domestic violence despite the fact that the women's movement in India came to the fore campaigning against the issue. This is largely because, like in the rest of the world, in India too there is a tendency to overlook the incidence of the phenomenon with only the few heinous cases attracting media and public attention. According to Mahajan (1990), we have limited knowledge on family violence. Not much research has been done, he says, and for a variety of reasons. Firstly, the semi-sacred nature of the family in our society makes research into family violence a taboo. Secondly, research into the family has been largely devoted to the study of the joint family which diverted attention from family conflicts in general and physical violence in particular. Thirdly, paucity of research on family violence can be attributed to the apathetic attitude of society which has relegated intra-family violence to a form of individual pathology and has led members of the family to believe that physical conflicts in the family do not constitute violence. Sriram and Bakshi (1988) in their study of 617 battered women found that in the percentage distribution of causes of violence against married women, dowry demands, extra-marital affairs and bigamy, alcohol and gambling were the highest. Their analysis revealed that for more than 50 per cent of the cases, regular beating was a fact of life. Besides manual beating, 10 per cent of the women were assaulted with instruments. Ranjana Kumari's study (1989) of dowry victims shows that one in every four was murdered or driven to commit suicide and more than half (61.3 per cent) were thrown out of their husband's house after a long drawn out period of harassment and torture. Gautam and Trivedi (1987) found that the victims were mostly young (18-30 years), less educated than their spouses, dependent on husbands or in-laws for their living and mostly died from burn injuries [Action Aid 1994].

Over the past few years, the phenomenon of women burning and rapes has registered a sharp increase throughout India. In Delhi on an average in 1983, two women died of burns everyday. In Bombay, a survey from two police stations indicated that in a period of eight months in 1984, one woman was burnt to death every five days. In Bangalore, suicides and 'dowry deaths' nearly doubled in 1984 as compared to the previous years. According to police reports, on an average two women committed suicides every day in 1984. In Madhya Pradesh, records from the biggest hospital showed that one woman died of burn injuries every five days. According to various women's organisations an equal number of burning/suicide cases go unreported. Mostly this is on account of the refusal of the police to register the cases or when they do register, they tend to minimise the offence.

Crimes against Women in Chennai

As a background to a field study, an attempt was made to focus on the phenomenon of crimes/violence against women in Chennai city in the period 1986-1996. Also juxtaposed with the said data is the national level data to highlight trends and focus on police action with respect to the same.

According to the National Crime Records Bureau data of 1994, the following patterns were observed at the national level (Table 1).

As is evident from the table, the overall trends in crimes against women from 1990 to 1994 registered a gradual, steady increase of 45 per cent. A closer look at the data revealed that the highest increase was in the area of 'torture' of women; i e, harassment for dowry under Sec 498-A of the IPC. Also, at a national level, the incidence of crimes showed a consistent pattern of increase from 1990 to 1994. So also, the proportion of crime against women went up to 5.6 per cent in 1994 from 4.3 per cent in 1990.

The National Crime Records Bureau has classified all the states and union territories on the basis of high crime prone and less crime prone. Tamil Nadu ranks eighth among the list of 10 high crime prone states. With specific reference to Chennai, the trends in the crime against women from 1990 to 1996 November as per the Chennai Crime Records Bureau are as shown in Table 2.

The incidence of crime against women has not followed any particular pattern as is evident from Table 2. While remaining more or less constant from 1990 to 1992, the incidence of crime shot up by nearly 55 per cent in 1993. The incidence came down significantly in the two years that followed, but shot up by 121.5 per cent in 1996 as compared to the figures in 1995. A possible explanation to this could be that the reporting went up in 1993 following the establishment of three all-women police stations in Chennai; first at Greams Road in 1992 and then at Adyar and Kothwalchawdi in 1993. The phenomenal increase in 1996 could be attributed to a rise in the actual incidence compounded with increased reporting owing to the knowledge of and the access to a woman-dominated set-up like the all-women police station. As has been mentioned above, the above data does not include cases of sexual harassment since these are registered under the 75 Madras City Police Act to enable speedy disposal. Only the offences which are considered to be of a 'serious' nature are registered under the IPC.

Table 3 depicts the progression of crime against women in Chennai in the period 1986 to 1996 November as per the data available with the Chennai Crime Records Bureau.

From Table 3 it is evident that over the years, there has been a distinct upward climb in the incidences of dowry deaths

Table 2: Proportion of Crimes against Women in Chennai against Total IPC Crimes 1990- 1996

Year	Total IPC Crimes	Crime against Women (IPC Cases)*	Per Cent Increase over Previous Year	Per Cent to Total IPC Crimes
1990	12,372	66	–	0.5
1991	12,633	74	+ 12.1	0.6
1992	13,174	77	+ 4.0	0.6
1993	6,930	119	+ 54.5	1.7
1994	5,987	86	- 27.7	1.4

and harassment for dowry, while in the other crimes, the trend is mixed.

The police set-up is an important law enforcement machinery which is resorted to by the masses as natural redressal forums. Tables 4, 5 and 6 provide an overview of the action taken by the Chennai police department with respect to crimes against women specifically in the cases of dowry death, harassment for dowry, rape, molestation and sexual harassment as per the data available with the Chennai Crime Records Bureau. In Table 4, the police action is depicted in terms of the number of cases reported (Rep); convicted (Con); acquitted (Acq); pending investigation (PT); under investigation (UI); action dropped or facts misrepresented (AD/MF).

The law enforcing machineries have an important role to play in the checking of the phenomenon of violence against women. As is apparent from the above table, the number of persons convicted of as serious a crime as dowry death is only 3.7 per cent while the number of persons acquitted is as high as 36 per cent. As mentioned earlier, more often than not, this is owing to lack of 'adequate' evidence. It is common for a woman's death to be construed as 'accident' or 'suicide' resulting from a loss of status owing to the suspicious moral character of the woman. The guilty manage to suppress all evidence and emerge victorious. In the case of harassment for dowry, 55 per cent of the cases are still pending trial while another 31.4 per cent of the cases are still under investigation. It would come as no surprise if the rate of convictions in these cases would also follow a similar pattern. Such matters are normally viewed as private domestic disputes where evidence is fairly difficult to collect. Also, dowry is considered so much an integral part of a marriage by all sections of populations and is seeped in so widely in the Indian cultural norms, that viewing dowry demand as a crime is still to meet with appropriate righteous indignation. 20 per cent of the molestation cases could not meet with any concrete action owing to either 'misrepresentation of facts' or the concerned parties taking back the cases. This is not in the least surprising owing to the phenomenal pressure that is experienced by the parties who decide to act against injustice.

The conviction of the husband may not be the best solution to the problems of a battered wife. The various alternatives that she has to choose from, each one in itself a compromise, may make it impossible for her to follow up the criminal case. Since the law does not protect a woman's right to the matrimonial home, or offer her shelter during the proceedings she may have no other choice but to work out a reconciliation. At this point, she would be forced to withdraw the complaint as the husband would make it a pre-condition for any negotiations. Secondly, if she has decided to opt for a divorce and the husband is willing for a settlement and a mutual-consent divorce, again withdrawing the complaint would be a pre-condition for such a settlement. Thirdly, if she wants to separate or divorce on the cruelty, she would have to follow two cases, one in a civil court and the other in a criminal court. This would exert tremendous pressure, especially when she is at the stage of rebuilding her life, finding shelter, employment and child care facility. If compelled to choose between the two proceedings, most women would opt for the civil case where they would be entitled to maintenance, child custody, injunction against harassment and finally a divorce which would set them free from their violent husbands [UNESCO 1993]. Needless to say, the process causes tremendous amount of emotional trauma. Moreover, the struggle involved in wading through the various layers of the infinitely slow moving bureaucracy is also enormous. Hence, very often, parties are forced to abandon their struggle midway or are compelled to resort to some kind of out-of-court settlement.

Undoubtedly, the incidence of violence against women within the family has been on the increase too in the past decade as is revealed by Table 5.

The trends evident in Table 5 are quite disturbing. Familial violence in the first half of the decade formed 27.66 per cent of the total number of crimes reported. However, the incidence jumped to an alarming high of 66.34 per cent in the latter half. One possible explanation could also be that the reporting went up during 1991-1996. This could be due to the heightened levels of awareness created by widespread media coverage and attention on the issue; setting up of all-women police stations, family courts; awareness about the legal amendments like 498A and the innumerable campaigns waged by various activist groups throughout the country.

In Tamil Nadu, the Tamil Nadu State Legal Aid Board plays a fairly significant role in the cases of battered women, dowry-related problems and such other matrimonial disputes. Table 6 gives a brief analysis of the cases handled by the Board in Chennai from 1993 to 1996.

Cases are considered settled when the parties either reconcile to live together or go in for a mutual-consent divorce. When either parties are unable to reach a workable solution or are unclear about their expectation or seek the assistance of some other forum, cases are closed or disposed of. Family court is the destination for women seeking maintenance, divorce, custody of children or restitution of conjugal rights. However, it needs to be borne in mind that in cases of prosecution for dowry harassment or dowry death, legal action is entirely dependent on the police investigation. More often than not,

cases get hushed up at the investigation level itself owing to the cumbersome, laborious and lengthy process of evidence gathering which is wrought with unwilling witnesses, corruption and so on.

It is important to bear in mind that both at the national and at the local levels, statistics specifically on wife-battering as a crime is conspicuous by its absence. Indisputably, battering would be an intrinsic component of the rampant incidences of harassment for dowry and dowry death. Whether a rightful cognisance of the problem at an early stage would save women from disastrous consequences is a matter which does not need too much thought.

Summary of Findings

A sample of 90 battered women for an in-depth study was purposively drawn from the Tamil Nadu State Legal Aid Board's Counselling Centre for Women, the All-Women Police Stations (Greams Road and Kothwalchawdi) and counselling centres-cum-shelters for victims of domestic violence run by voluntary organisations and women's groups in Chennai. The study primarily focused on obtaining an in-depth understanding of the phenomenon of wife-battering and gain insights into the situations that battered women face on a daily basis and the nature of violence – physical, mental and psychological – endured by them for prolonged periods. In addition to focusing on the responses of women, the study also highlighted the structural and other constraints under which decisions about help-seeking, leaving or reconciling to the situation have to be taken.

It is obvious that wife battering cuts across all religions, castes, and educational level barriers. While Hindus formed a majority of the sample, the proportion of Christian women was far higher than that in the population which could be due to higher reporting. Muslim women formed a mere 3.3 per cent of the sample. A combination of factors ranging from greater community level support systems to low literacy to lack of awareness of options could be possible explanations of this phenomenon. Also, the phenomenon is prevalent in all castes ranging from most backward caste/other backward caste, scheduled caste and scheduled tribes and forward castes. This was amply evident from the fact that women from all these groups were seeking help from the three referral points. Significantly the majority of the respondents were aged below thirty years highlighting the high incidence and/ or reporting of the problem and thereby the vulnerability of young women to abuse. The sample showed respondents with fairly high educational levels with a mere 10 per cent of them being illiterate. Seventy-nine per cent of the women had received formal education ranging from primary to the higher secondary level and 11 per cent were graduates/postgraduates. While it is evident that irrespective of educational levels all women are victims of wife-battering, it is also evident that with a significant level of education, women are unwilling to put up with exploitative situations.

Most of the respondents were largely homemakers and their economic dependency heightened their vulnerability to abuse too. Nearly 70 per cent of the women who had been employed prior to marriage had been forced to quit work by their husbands. However, a significant proportion of the respondents took up employment as a direct consequence of abuse and donned the role of the consistent breadwinner for the family. However, owing to the lack of skills, most respondents were engaged in semi-skilled labour in the various export units in and around Chennai city. Most of the respondents' husbands had the opportunity to acquire skills which enabled them to negotiate better in the labour market and also earn incomes that were significantly higher than those of the respondents. The families of both the respondents and their husbands were mainly engaged in blue-collar jobs. Overall, the respondents in the sample hailed from middle and lower-middle socio-economic strata. While most respondents had gone in for arranged marriages, a significant proportion (35.5 per cent) had opted for self-arranged marriages which ranged from inter-caste to inter-religious marriages. With marriage seen as an ultimate goal in a woman's life, over 60 per cent of the respondents had been married before they had turned 20 highlighting the trend of early marriages prevalent in Indian society. Not too surprisingly, the onset of abuse, therefore, in the majority of the cases (nearly 70 per cent) was well within a year of marriage. This was irrespective of the type of marriage; either arranged or choice. In as many as 44 per cent of the cases, the onset of violence was within a month of marriage. All the women, irrespective of education or class backgrounds, experienced various forms of violence ranging from severe physical battering to psychological and sexual abuse. Physical violence constituted 50 per cent of the total number of abuse while psychological violence formed 48 per cent including economic deprivation, desertion, restrictions on mobility and so on. On an average, every woman experienced twelve different forms of abuse with varying frequencies. Almost all the women reported being slapped/beaten, kicked and insulted in the presence of others. Seventy-nine per cent of the women experienced violence on an everyday basis. Almost always, the causes for battering were multiple. Suspicion of infidelity, alcoholism, dowry and instigation by in-laws formed the main causes of violence in the case of most respondents. Verbal retaliation and independence and confidence of some women posed a real threat to men and heightened

their vulnerability to increased violence. Significantly, the type of marriage that the respondents had opted for had no bearing on either the onset, frequency, or causes of violence.

The phenomenon of continued violence on the respondents had adverse multiple consequences on the women ranging from injuries to acute tension and anxiety, lowering in self-esteem and nervous breakdown to internalisation of shame and guilt. This affected women's responses to the clearly exploitative situation: they took a long while to actively respond to the situation. Complaints to natal family was the most common form of response. Gradually, many women also retaliated verbally. Over a period of time, women's efforts at help seeking became fairly evident and multi-pronged; they started seeking help from various informal and formal sources which included parents, siblings, in-laws, friends/neighbours, community leaders, employers, police, counselling centres, lawyers and doctors. Significantly, in an overwhelming 92.2 per cent of the cases, parents of the respondent had been the most consistent primary source of support. Among the formal help sources, police and counselling centres were most prominent. However, as mentioned earlier, help was sought actively only after a prolonged period of abuse. Sixty per cent of the women had sought help only after six months from the onset of abuse. In most cases, this was due to an irrational hope that things would change for the better. Educational level, type of marriage and time of onset of abuse had no impact on propelling women towards early help seeking.

In keeping with the earlier observation, despite all the dilemmas, complications and compulsions linked with parental support, an overwhelming majority found their support to be a turning point in their lives. Similar sentiments were expressed regarding the intervention of the counselling centre at the TNSLA and those run by voluntary organisations. However, over 65 per cent of the respondents found interventions at the all-women police stations to be less useful or totally useless. It was amply clear from the patterns in the respondents' help seeking that their expectations of formal bodies was respect for their decisions and a tangible outcome in keeping with their personal choices. Most respondents found the authority of the police stations, intimidating, while by contrast, the atmosphere of the counselling centres especially those run by voluntary organisations extremely reassuring.

When women's effort at help seeking met with repeated hurdles, a majority of them (53.3 per cent) resorted to an extreme step of attempting suicide. This phenomenon was specifically observed alarmingly among younger women, who, undoubtedly experienced a heightened sense of vulnerability driving them towards desperation. Of the women who had attempted suicide, as many as 76 per cent had done so more than once.

At a certain point, some violent incident served as the precipitating factor and prompted many women to leave the marital home. Over 60 per cent of the respondents had left their matrimonial homes due to reasons ranging from increased violence, incurable alcoholism, intolerable levels of suspicion and so on. A significant proportion of women had subsequently sought refuge in their parental homes while others had found a safe haven in shelter homes run by voluntary organisations. 42 per cent of the women who had left their marital home continued to be harassed by their violent husbands who attempted repeatedly to persuade them to return, beat them up for money, claimed access to children and so on. Also, while an overwhelming 69 per cent of the women were clear about their decision not to return, the others were ambivalent but were willing to return if their conditions were met.

On the other hand, the sample also comprised of women who had at an earlier date reconciled with their husbands owing to interventions of the officials at the three referral points. The reasons for the same included advice given by the counsellors, economic dependency, concern for children's future and so on. However, of the women who had reconciled, a significant 44 per cent had not experienced any change in their situations while another 41 per cent perpetually feared the outbreak of violence or were unhappy about only partial resolution of their problems.

Irrespective of whether they were separated or still living with their husbands, most respondents felt trapped, helpless and confused about their uncertain future. Significantly most women in the shelter homes were distinct by the clarity they exhibited about not wanting to return to the violent relationship and were well on their way to carve out an independent existence for themselves and their children.

The need of the hour is the conscious classification of wife-battering as an intrinsic and integral part of violation of human rights. It is imperative to recognise woman-battering as a serious social crime and accord it the same status as other crimes. It is also vital to recognise the role of the media in shaping societal attitudes, values and public opinion. Responsible media portrayal of women's lives and minimising negative, stereotypic imagery are essential steps in achieving the said goal. Public services need to be made more accessible especially to women in crisis situations. Also, while it is necessary to review as well as initiate services for battered women, it is far more important to consciously move away from the image of battered women as victims. Rather, it is imperative to view them as survivors negotiating spaces with several informal and formal set-ups which, in fact, need to be revamped to empower women in a positive fashion. One of the biggest hurdles in the recognition of wife-battering as an issue of importance is the failure to transcend the public/private dichotomy regarding the issue. The challenge remains; in terms of formulation and implementation of strategies, legislations and sensitising of machineries to effectively deal with the multifarious manifestations of violence against women. Above all, there is an urgent need for drastic changes in societal attitudes towards battered women and also those of professionals involved in dealing with/helping them.

Female Autonomy in Tamil Nadu

Unravelling the Complexities

T K Sundari Ravindran

Commentators on Tamil Nadu's rapid fertility decline during the eighties often cite female autonomy and 'agency' as important contributing factors. This paper examines the extent of female autonomy Tamil women enjoy in their personal lives and within their households and the gender power dynamics between married couples, on the basis of a study in five districts of the state.

STUDIES on women's status and autonomy in India have observed that women in the southern states of India enjoy greater autonomy than their north Indian counterparts. For example, analysing the demographic differences between the north and south Indian states, Dyson and Moore (1983) have held that marriage and kinship patterns in south India permit women to have more freedom and decision-making authority. Women are more likely to marry a close kin, or within their village of birth, and have greater social support from their natal family. Their physical mobility was also less restricted. A more recent study [Murthi, Guio and Dreze 1995] on the same question confirms that the differences cannot be explained except with respect to social and cultural advantages enjoyed by women in south India as pointed out by Dyson and Moore and others.

More recently, commentators on Tamil Nadu's rapid fertility decline during the eighties have tended to cite female autonomy and agency as important contributing factors, based on the relatively higher rates of female literacy and labour force participation in Tamil Nadu. A Sen (1995) has, for example, argued that Tamil women's agency, through its impact on their ability to make 'reasoned decisions about fertility' is an important factor in the state's fertility decline. Jejeebhoy (1997) examines the dimensions and determinants of women's autonomy in Tamil Nadu and Uttar Pradesh. It concludes that Tamil women enjoy far greater autonomy than their north Indian counterparts in terms of almost every index of autonomy considered: decision-making authority, mobility, access to and control over resources, and to a lesser extent, freedom from threat by husbands.

This relative perspective may obscure the nature and extent of gender bias experienced by Tamil women. Karin Kapadia (1997) who examines dimensions of gender inequalities across social classes and castes in Tamil villages concludes that gender inequality cuts across all classes and castes, and that women's status is steadily falling especially in the 'middle castes' which are economically bettering themselves.

Empirical evidence on some of the more commonly used indicators of women's status is however, mixed. Tamil Nadu has the second highest female literacy rate in India – 52.3 per cent, but this is far below that for Kerala (86.9 per cent) which ranks first. Female work participation rate, at 30.88 per cent in 1991, ranked fourth highest in the country (1991 census). But this was accompanied by a decline in the proportion of rural women working as cultivators, and a significant increase in the proportion working as agricultural labourers, and more importantly, as workers in the non-farm sector.[1]

Further, during the decade 1981-91, there was a steeper decline in sex ratio (female per 1,000 male) than in the previous decade; the female infant mortality rates, which were till then generally lower than male IMR, became consistently higher.[2] Data from a sample survey conducted in 1996 showed exceptionally high female IMR in three districts: Dharmapuri, Madurai and Salem, with the ratio of female to male IMR of 1.9, 1.4 and 1.1 respectively. Female infanticide has been reported from several parts of the state, and recent data show that 'social causes' (read infanticide) accounted for 8 per cent of infant deaths in 1995 [Athreya and Chunkat 1997].

The present paper examines the extent of autonomy Tamil women enjoy in their personal lives and within their households and the gender power dynamics between married couples, based on in-depth interviews carried out in five districts of Tamil Nadu, with 141 women and men belonging to different age and caste groups. For information on perceptions on women's status, we have used information gathered in focus group discussions.

The paper is divided into four sections. The first section examines the concepts of status and autonomy and outlines the definitions used in the present instance. The second section describes the study methodology and characteristics of the respondents. The third section presents findings from the qualitative study, and is followed by the section with concluding observations.

I

Women's status is a multidimensional entity, and different studies tend to focus on different aspects of status. Education and employment – the two indicators of women's status often used, have a problematic relationship to status. Better education or engagement in paid economic activity may not necessarily be indicative of/lead to greater autonomy or better status. In fact, women's entry into the paid labour force as a consequence of impoverishment is a well-documented phenomenon.

The various components of status may move in different directions in a given time period, so that defining what constitutes 'improvement' or otherwise, is a difficult task. For example, as Swaminathan (1997) points out, women's entry into the labour force may have very negative consequences for their health. Again, women's status can be conceptualised at aggregate and individual levels; there may be differences in how a variable behaves when considered at the different levels. Dixon (1978) defines women's status as their overall position in society, and distinguishes this from 'power' which identifies with women's ability to influence and control at the interpersonal level. In other words, like children, women could also be highly valued and at the same time, controlled and dominated.

In a further elaboration of the concept of female power, Safilios-Rothschild (1982) identifies two types of power – that which is derived from men, and power which is derived independently of men. The former consists of the power that women may enjoy because of who their fathers and husbands are. The latter includes women's ability to control decisions about their productive and economic activities, including freedom of movement and control over the resulting wage or income; and ability to have an important say in decisions which affect their lives. It must be clarified that female power in

this instance is not used in terms of 'power over' but in the sense of 'power to': "power-to is the ability to perform or produce, and implies also the freedom and resources to do so. Power-over refers to domination and control" [Goodrich 1991]. Viewed in these terms, female power is very similar to the concept of female autonomy used in many studies. Autonomy has been defined as "the ability...to obtain information and use it as the basis for making decisions about ones private concerns and those of one's intimates" [Dyson and Moore 1983].

Jejeebhoy (1995) identifies five separate but interdependent aspects of female autonomy as important in the education-fertility relationship. (i) Knowledge autonomy -- knowledge of, and exposure to, outside world; (ii) Decision-making autonomy: having a say in decisions concerning their own lives and well-being; (iii) Physical autonomy in interacting with the outside world; greater mobility; (iv) Emotional autonomy: less self-denial among women; greater bonding between couples and between parents and children than with the extended kin; and (v) Economic and social autonomy and self-reliance: access to and control over economic resources, increase in self-reliance for social acceptance and status. In a more recent paper [Jejeebhoy 1997] she has added on an additional dimension: freedom from threat of violence from husbands. Literature on women's reproductive rights identifies women's security in and control over their bodies as the core of female autonomy. This includes control over decisions related to sexuality and fertility, and freedom from violence.[2]

In this paper, female autonomy is used in the sense of having control over significant decisions affecting their lives, and having access to the resources that would enable them to do so. While the paper examines access to resources and women's control over decision-making within their households, it focuses centrally on women's ability to make choices regarding their marriage, sexual lives and childbearing, and freedom from threat of violence. This is a deliberate choice, reflecting this author's conviction that women's control over their bodies is fundamental to their autonomy.

II

This paper uses data collected as part of a larger qualitative study on fertility transition in Tamil Nadu.[3] Fifteen villages from six districts were purposively selected to cover a broad spectrum of fertility levels and levels of female literacy (as an indicator of social development), to be able to capture experiences from varying contexts. The districts from which villages were selected were: Chidambaranar, Tiruchy and Periyar (four villages each), Tirunelveli, North Arcot and Tiruvannamalai (one village each).

Field work was carried out between November 1994 and July 1995. The team of researchers consisted principally of young men and women with experience working in development projects and with considerable 'people' skills, but also included two recently graduated masters and doctoral students with specialisation in demography and sociology, respectively The research team spent two months in preparatory work, visiting all the 15 villages once, meeting key informants and carrying out house-listing. A second visit was made to each village to carry out focus group discussions for the fertility transition study mentioned above and the in-depth interviews on which this paper is based. In each village, the research team stayed with one of the families throughout the period of data collection.

Some of the respondents for in-depth interviews were identified from the focus group discussions. Others were identified based on the information we had from the house-listing. In each village we aimed at including women and men from different age and caste groups. We also recruited those who were not likely to participate in focus groups because the topic of discussion was childbearing and family planning: widows and separated women, childless women and men. Interviews were conducted at a venue chosen by the respondents, and often took place in the room where the research team stayed, because of the privacy it offered. Interviews were conducted by research team members of the same sex as the respondents.

The interviews were not one time events but took place over two or three sittings. These were not taped but detailed notes were taken verbatim, and the report written up immediately after. In fact, it may be a misnomer to call these 'interviews', because the conversation did not take a 'question and answer' format. We started with an open ended question about their lives. The flow of the respondent's narrative was not interrupted as far as possible and there were only gentle probes occasionally to get more details on specific issues of interest to us. Information from interviews was often supplemented with data and insights gathered in the course of day-to-day interaction with the respondents.

A crucial factor influencing the whole data gathering process was the way the research team members merged into the village community because they were all from a similar socio-cultural background. The women helped with carrying water, cooking and minding children for the families they stayed with; and the men hung around with the youth, went for walks and played card games. There was one instance when one of our women field workers, on request from one of the respondents whose husband was away for the night, spent the night in her house for 'thunai' (to provide company because it was not appropriate for women to spend the night alone) and carried out the interview during this time.

The population of the villages varied from 596 to 12,571. Seven villages had an SC population of below 10 per cent, and in four of these, it was less than 2 per cent. In six villages they constituted between a tenth and a quarter of the population and in only two villages did they form as high as 44 per cent of the population.

Agriculture was the main source of income in all but two villages. Agricultural income, however, was perceived to be dwindling, and the failure of rains and water shortage are repeatedly mentioned. Entire families of those dependent on wage labour migrated in search of work during the off-season in nine of the 15 villages. Work opportunities for women were mostly in agriculture, and their wages were often half that of their male counterparts, varying between Rs 5 and Rs 25 per day.

It is difficult to describe the study villages either as 'developed' or 'underdeveloped'. A great deal of investment has gone into infrastructural development, but basic livelihood issues have not received adequate attention One gets a sense of there being infrastructural development without human development. For example, all but one village was connected by buses to the nearby town. The Tamil Nadu Integrated Nutrition Programme was operational in all, and the ICDS operated balwadis in 10 of the villages. The bigger villages had post offices, markets, banks and credit co-operatives, and eight of the 15 villages have a telephone within the village. In 12 villages there is a community television provided by the government for public viewing. The presence of 'dish antennas' accessing satellite TV channels was a feature of all the villages.

Twelve of the 15 villages had a primary school, and the remaining three, within three km walking distance. Government health facilities were present in eight villages and were dysfunctional in all but one. There were taps and borewells in 13 villages but water shortage was still very

such as drainage and toilets were absent in all villages, roads criss-crossed with channels of dirty water attracting mosquitoes a common sight

The situation of the scheduled castes and of the scheduled tribes (in the one village where there was ST population) was vastly different from that of their counterparts from other castes. In one village scheduled caste children were unable to attend the local middle school because the Moopanar community won't let them. In another, there had been a recent incident of rape of a 16-year old SC agricultural labourer by the farm owner. Another SC hamlet was a crowded, low-lying settlement with no infrastructural facilities including water and were not permitted to fetch water from the upper caste section of the village. The ST population eked out a miserable existence, finding employment as migrant workers in neighbouring districts for only part of the year, and living on roots and coarse cereals grown in small patches of land. The table summarises the characteristics of the respondents.

III

Perceptions about changes in women's situation in the family and society were discussed at length in the focus groups and spontaneously expressed in some of the interviews. There was agreement overall, among young and older men and women, that women were better off now than they were before. More of them were educated, more of them were employed, and their prospects were bright Further probing however revealed that reference to better employment and upward mobility was in general terms of what they now saw as happening around them in the world at large, and did not represent the situation in their villages or in their own lives.

The most graphic example of this was encountered in a focus group discussion with young women, when a 16-year old who has been married for a year said that women were now doing well for themselves: they were now collectors and police officers, judges and ministers. When asked about her own life, she responded saying, "what if this is not true in my case? It still shows that women are capable of doing everything men do " There was one exception to this general perception, where the women's group felt that women's lot may have improved among those who are well-off, but among the poor, nothing had been gained.

Besides the general feeling that women were doing better, some definite changes

and men, women today dressed better, were modern ('naagarigam') and knew how to speak to strangers and conduct themselves in public. The men were proud of these features in their wives. The older women said that younger women were more confident these days even if they had only a few years of schooling. They knew more about the world ('vevarum'). They brought up their children better.

There is a positive attitude to educating girls especially among the women. They would like their daughters to study and get jobs, and earn a 'sircar' salary. Those who are not educated and are at home have to be under the man's thumb; those who go out and work in offices can be equal to men; in fact, they are equal.

Practically no one (barring isolated exceptions) male or female, was against women's employment either. Women's employment was seen as necessary to be able to meet the increasing expenses towards the children's upbringing. Some of the women's groups stressed on the relative financial independence that came with 'having five rupees in one's hands '

Perhaps because of their awareness of what is possible for women if given the opportunity, there is a great deal of dissatisfaction with not having received much help from the government to further their status There are no development programmes for women in most of the study villages. The 'Arivoli Iyakkam' has been a positive (literacy programme) experience in one village, and an NGO programme helps some women supplement their income in another village. Women want jobs and the possibility of earning a livelihood, and not 'income generating programmes' to supplement their (non-existent) income.

Against the backdrop of these perceptions, we now examine actual life experiences of the women and men.

Access to Resources in Childhood

Son preference and discrimination against girl children in India with respect to investment in their health and well-being, and on their education, is a well documented phenomenon. The macro data for Tamil Nadu – the falling sex ratio, the female excess mortality in infancy and childhood and the gender gap in educational attainment – also indicate the presence of differential treatment, if not discrimination. In the present study, only three women reported very severe ill-treatment in their infancy and childhood because they were girls. Two others were

not bear any sons.

Because both of us (my older sister and me) were girls, my father ill-treated my mother and us. We got no treatment when we were sick. He would not lift us up even if we cried. I believe I was three months old, sleeping in my cloth cradle and my mother had gone out to fetch water. I woke up and cried. Irritated, my father held me in one hand and beat me like a monster. An old lady from next doors came running and shouted at him, 'do you have no sense?' And he said, "I wish these were dead, they don't seem to die, cursed ones." (30 year old non SC woman, no schooling, cultivator.)

He curses the baby girl all the time, if she cries he says, 'is she going to earn me a

Notes. * Castes included are: Moopanar, Thevar, Vanniyar, Pillai, Sengunda Mudaliar Ahamuday Mudaliar, Nadar, Chettiar, Padayatchi, Gounder, Achari and Barber.

@ This includes five women and four men who are recently married, and four women, six men who have no living children after several years of marriage.

fortune, the forebearer of daridram (poverty, destitution), go throw her out somewhere. He wants a son. I really, fervently hope that this baby (pregnant now) is a boy. If not, I have to keep hoping and trying. (19-year old SC woman, 10 years of schooling, home-based; first child is a girl.)

One of the men mentioned that his mother had advised him to 'do away with' (kill) his second and third daughters. Interestingly, he did not belong to any of the castes in which the practice of female infanticide has been reported in recent years, but a poor scheduled caste agricultural labourer. Differential feeding in later childhood was mentioned by several women who talked of their brothers receiving eggs and meat while they were not. Girls were expected to control their desire for food, and a popular Tamil saying was often cited in this connection: '*undir surungudal penditkkazhagu*': to restrict one's food intake is becoming of a woman.

> They'd give my brothers egg fry, but not to me or my sisters. I used to ask my mother, are we not born of the same mother? And she would reply, "you girls go away to another man's house after all. The boys will take care of us." (43-year old woman, non-SC, eight years of schooling, secretary of local AIADMK party unit.)

There does not appear to have been overtly discriminatory attitudes to girls' education even 20 to 30 years ago. More often than not, non-enrolment was a feature of one's caste and economic status, and common to both boys and girls. On the other hand, when resources were scarce or when there was a need for child care support, the decision regarding who would continue schooling was directly related to gender role expectations. The girls stayed back at home to carry out housework and care for their younger siblings and sometimes combined this with wage work in agriculture. The boys remained in school in preparation for their roles as future bread winners.

> I studied only up to class 5. They could not afford to educate me further. All household tasks became my responsibility. Because of the belief that boys should not work (at home), I was retained at home to cook, clean, wash vessels, etc. Mother used to work as agricultural labourer. (36 year old woman, non-SC, five years of schooling, home based.)

> Both my father and my older brother made me do all their work: keep their plates, wash after them, keep hot water ready when they come from work.. All this even though I was myself working outside the house.(30-year old woman, non-SC, five years of schooling, home-based.)

Menarche, referred to commonly as 'coming of age' was a major turning point in the lives of girls. Perceived as the marker of a girl's readiness for marriage and motherhood, it brought with it restrictions over her interaction with men and boys and on her physical mobility. There is an implication that the adolescent girls' unbridled sexuality needs to be controlled 'for their own good', so that they do not 'get into trouble'. A code of conduct was imposed on them, appropriate for a 'good' (sexually moral) woman who would uphold her family's honour. Despite more girls than before getting educated and finding employment outside the village, the essence of this code of conduct has remained unchanged.

Restrictions included not being allowed to go out of the house alone, or visit neighbours without being accompanied by older relatives. They could no longer linger on their door steps in the evenings, amusing themselves with watching passers-by, or get together with other girls and have fun. Even laughing aloud was not permitted in some households. The purpose of these restrictions was to prevent the girls from getting involved with boys. This was conveyed to the girls in explicit terms in most instances.

> If I talked to any boy, he would thrash me. There had been instances of girls getting pregnant before marriage, in my village. That is why he did that.(18-year old woman, SC, no schooling, agricultural wage labourer.)

For girls who were still in school, menarche usually meant discontinuing their education. The very few women in our study who continued schooling after menarche did so because there was a high school in the village where they lived. However, to be permitted to continue their schooling, they had to establish the trustworthiness of their conduct, going to school with their "eyes focused on their big toes and never stopping to talk to anyone".

What of the many girls who went out to work in their own fields, or as wage labourers? They were usually permitted to work only within the village; but when economic necessity made work outside the village unavoidable, they were sent out in groups, accompanied by older women known to the families concerned, or by their older brothers. They were watched over by their mothers, brothers or kinsmen, and were not allowed to talk to men who were not related as brothers ('annan murai'). Girls seldom questioned these restrictions:

> I don't think I minded these restrictions. It is parents' responsibility (to impose these) (40-year old woman, non-SC, no schooling, agricultural wage labourer.)

Fear of 'losing all respect' and 'getting themselves a bad name' was a powerful motivation for abiding by these codes of conduct expected of 'good' girls.

> Even if I spoke to the boy next door people used to say I was not behaving modestly. So I became more careful (30-year old woman, non-SC, 10 years of schooling, cultivator.)

> My mother used to say, "behave in a way that no one can say anything wrong about you". I took it as a challenge, decided I will prove that I can live like that. (33-year old woman, non-SC, eight years of schooling, home-based.)

There were only a few expressions of disapproval or protest:

> I used to be very hurt and insulted, for his lack of trust in me. I have often cried about it (18-year old woman, SC, no schooling, agricultural wage labourer, cited above.)

> I hated it. I still think this is very bad, it destroys women's self-confidence. What is the point in caging them at home? Who benefits? (37-year old woman, non-SC, eight years of schooling, beedi worker and convener of the local mahila mandal.)

Choice of Marriage Partner

The freedom to decide whether, who and when to marry, among the most fundamental aspects of a person's sexual autonomy, was not available to most women. Sixty-five of the 70 women in this study had their marriages arranged by their parents and relatives, and of these, only six were even asked if they approved of the groom chosen for them.

> In those days, it didn't matter whether or not you liked the groom. It was as the parents decided. (37-year old woman, non-SC, no schooling, agricultural wage labourer, cited above.)

Roughly just over half the women had married their 'murai payyan' or marriageable kin – the mother's brother, or the father's sister's son – and were therefore acquainted with the person they were to marry. Of the six whose consent to a marriage alliance was ascertained prior to the wedding, only one woman rejected three offers, and agreed only to the fourth. In other instances, they merely acceded to their parents' wishes. For the most part, this was because they believed that their parents knew what was best for them. But they sometimes consented even when they were not quite happy with their parents' choice:

> Father fixed marriage, then asked me if it was okay. I said it was as he wished. That's what I was expected to say. My husband was not very good looking, not educated. But that was my fate. (46-year old woman, non-SC, 11 years of schooling, TINP staff; widow).

In some instances, parents did not pay heed even when the women explicitly expressed their unwillingness or dissatisfaction with the husband chosen for them. One of the respondents was married to a much older uncle (mother's brother) so that his property would remain within the family, even though the parents knew that she was in love with a neighbour's son. Another woman had to marry a relative because her mother could not afford a dowry. A third was told by her father that he would not keep her at home any longer, and that she had to marry the man her father chose. Three women were married as second wives, and one as a third wife, to married men. Several years after their marriage, they still regret having been forced against their wishes: "Marrying me to him was like giving a garland to a monkey" (AIADMK secretary cited above)

Expectations from a potential husband were basic – 'he should not drink, not beat me, and support me and the family' was the description most frequently heard. Some of the younger women had a few additional requirements – that the husband be educated and have a 'job', that is, be employed in non-agricultural work. There is a perception that younger women are more outspoken about their preferences and no longer just accede to their parents' wishes:

> ... girls these days .. say 'I like him, I want to marry him', even when parents don't approve. Or the other way around. These days girls specify - "he should be salaried, educated, modern". (36-year old woman, non-SC, five years of schooling, home-based.)

The few (five) women who married men of their own choice had known their future husbands for a very brief period. They met them in their places of work, or were related to them. Given the strict sex segregation and restrictions even against talking to men, the couple had to snatch fleeting moments of interaction with each other. Marriage became an inevitable outcome of 'people beginning to talk' of their attachment, and the men were compelled to marry the women in order that the women's 'honour' may be upheld. None of the women succeeded in getting parental support for their wedding, and had eloped and married in a temple.

All but one of the five women now regret their decision. The opposition from husbands' parents has made their lives miserable. Their husbands have not been able to break away from their parents because of financial constraints, and the women having come 'empty handed' (with no gold or cash as is usual in a traditional wedding), and not having any support from her natal family, has only exacerbated matters.

> He does not give me money, does not care about the child. But no one supports me, my brother says I have to face up to my decisions. Even yesterday my husband picked a quarrel and beat me badly. Today I went out with the baby in search of some poison to buy. I don't know what to do with my life, why I have landed myself in this hell. (25-year old woman, non-SC, no schooling, home-based.)

In contrast to the women, men were definitely asked for their consent even when they married the 'murai pennu' (marriageable kin – sister's daughter or mother's brother's daughter]. The few who mentioned being 'told' who to marry (6 of 71) were men aged 45 or more whose marriages are at least 20 years old. In a more recent development, men 'view' several 'suitable' girls before they make a final choice. And they were clear about a basic requirement of a prospective wife: obedience.

> I had seen seven girls before this Didn't approve of any. Either the girl was too talkative or much better off than me. These kind of matches don't work. They won't respect you With this girl, she was suited for my status, and more importantly, she liked me. So I knew she would be obedient. (23-year old electrician, non-SC, seven years of schooling.)
>
> I didn't want a girl from a well-to-do family. Then she would start demanding that she needs tiffin, not rice; that she wants silk sarees not ordinary ones, need a bathroom at home, want sandals for her feet. (29-year old school teacher, non-SC, secondary grade training.)

There were two men who had married 'for love', and once again, these turned out to be marriages entered into because 'people were talking' and the woman's 'honour was at stake' Both marriages were on the rocks.

Remarriage was rare among women, and those who had been widowed or separated had no choice but to remain single. There was only one exception to this, a woman whose husband was impotent who remarried. Even so, the decision to annul the first marriage and to remarry her to another man was taken by her father and brothers, and not by her.

While marriage was a once in a life-time event for a woman, a completely different set of rules applied in the case of men. Three men in this study had two wives. In one instance, the man had remarried because the first wife had not borne any children. The other two had married again because they fell in love, but had not annulled the first marriage. One man had remarried three months after his first wife had committed suicide following a quarrel with him. And a widower who had undergone vasectomy was able to find a young women to marry him.

Dowry and Choice of Partner

A majority of the women (55) did not mention dowry as a factor affecting their choice of a marriage partner. A few gold ornaments: usually earrings and nose stud; silver anklets, household utensils and bedding were the most common gifts given to daughters at the time of marriage. Those who were better-off gave more gold, and sometimes, land and cash. But none of these were demanded, they were gifts or 'seedanam' (tamil version of streedhan or bride wealth). What appears to have been more important are regular gifts of new clothes and ornaments given during festivals, at the birth of each child and when the grand daughter or niece 'came of age'.

Those who reported that their in-laws had demanded a dowry were all middle caste women from the Tiruchy, Chidambaranar and Tirunelveli villages. They had paid dowries in cash and gold, and in fairly large amounts: varying from Rs 3000 and three sovereigns of gold up to Rs 20,000 and 20 sovereigns of gold.

In the scheduled caste groups, dowry had not been a practice even up to 15 years ago, and the men said they had paid a bride price when they married. The women concurred, saying that even the gold was often given by the groom's parents. But this was no longer the case.

It is striking that dowry appears to have become an essential component of all present day marriage transactions, across castes. Women who have recently given their daughters in marriage report having paid dowries well beyond their means. One woman who had not given any dowry said that by the time her younger sister was married, her father had to sell his house and pay Rs 20,000. Others report of the anger and frustration of their husbands who feel cheated that they did not get dowry like the younger men now do:

> Every now and then he comes back after seeing someone else's house, and beats me up saying I did not bring any dowry. I once asked him, 'why did you marry me? You knew we could not give dowry.' He says, "I did not know then. When I see how chaps far less deserving get fat dowries, it makes me really angry." (25- year old woman, non-SC, no schooling, petty vendor.)

The focus group discussions also indicated that demanding dowry has become

a pervasive practice, including in those in which it was never the case earlier.

> It has seeped in everywhere like poison... . Even a cowherd asks for dowry and wants the wedding expenses taken care of by the bride's parents... In earlier times the girl was enough, they needed the girl to help in the house, to light the lamp in their house, so they even gave gold... The groom's parents would come seeking an alliance...they would walk a hundred times up and down to our house.

However, no one dared to challenge this practice, because it would affect the lives of their daughters. "If we don't give dowry our daughters would suffer, if we give they will live well. Don't we hear stories about stoves bursting and girls burning?" Or, "If we don't give dowry, the daughter will remain at home". Most young men admitted to having received a dowry, and said that they had not insisted on it, but did not see it necessary to refuse either. As one young man neatly summed up, it was "the need of the times and obligation of parents".

> As nagarigam develops, dowry has become widespread. In earlier times, the boys were uneducated, so they were not given a dowry. We are educated, modern, we deserve it (dowry) (25-year old tractor driver, SC, seven years of schooling.)

> My father never received any dowry – my mother was one of six daughters. I received 5,000 cash and 10 'pavun' as dowry. They say it is wrong to take dowry; but it is necessary. Because she brought cash, it was possible for me to invest in business and improve my earnings. (29-year old man, non-SC, cultivator, 11 years of schooling.)

A very poor scheduled caste father described how he aspired for dowry for his son – this was part of his aspirations for a better future for his children – because the son had 'completed class nine'. He himself was illiterate and had never been offered dowry, but the son's bride brought '1 sovereign of gold, a goat and a cow'. Men who married for love and did not ask for a dowry could be influenced to believe that they have been denied their dues·

> I sometimes regret having married someone who came empty-handed. I would have got some gold, vessels and all that. Even after the birth of two children they have given nothing at all. (32-year old man, non-SC, cultivator, 10 years of schooling.)

Some men even thought it fit to complain that while they had received sizeable dowries, they had received no gifts following the birth of their daughters/sons.

Unfortunately, the practice of demanding is likely to intensify discriminatory attitudes towards girls, and also seriously affect girls' perception of self worth. And given that it is young men themselves who favour and promote the practice of demanding dowry, it leaves women with very limited options in the 'marriage market' but to concede to arranged marriages.

The many restrictions on young girls' freedom to move around, and to associate with members of the opposite sex are aimed at ensuring that they remain 'unspoilt' virgins at the time of marriage. What is the extent of sexual autonomy women enjoy within marriage? More men than women talked about sex within marriage, and we have attempted to piece together a picture based on these limited accounts.

The men spoke of the importance of sex in a married relationship, and felt that if women understood men's sexual needs and were 'consenting' partners, there would be fewer problems within marriage.

> To put it plainly, happiness (pleasure) in life is only at night. The woman should co-operate in these matters.

Women's refusal or disinterest in sex could lead to conflicts.

> Sometimes, when I am in a 'mood' (for sex) and she gives excuses and refuses, I have beaten her. Then I'd take my bed and go to sleep outside the house. And she would follow me out, and beg me to forgive her, and take me back in. (37-year old SC agricultural labourer, three years of schooling.)

One man also mentioned that sexual satisfaction was what kept a woman happy and satisfied in marriage.

There appears to be a great deal of insecurity among men about their ability to keep their wives satisfied in marriage and faithful to them. They sought to ensure that their wives did not have the opportunity to associate with other men and 'get lured' away.

> Cinema has corrupted the women. It gives them ideas, and they decide they don't like their men and leave them for someone else [in 92]

> She shouldn't talk to men other than me; even to my brothers and relatives, only in my presence. If she violates this, she should be given 'soodu' (given a small burn with a hot metal – a form of punishment; but it is not clear if he uses this metaphorically, meaning punish her in a way it hurts, or literally). I'd do it because otherwise I'd become the laughing stock among other men. (35-year old man, SC, four years of schooling, agricultural wage labourer, has worked as construction worker in Delhi for many years before his marriage.)

G, a young man, whose wife had gone away to her parents' after a showdown with him saw this as an affront to his very manhood, and wanted to 'drag her back by her hair', because

> If you leave such women alone, to do as they wish, she will start 'grazing' as she pleases (term used to indicate having sexual relationships with anyone she desires). I'll bring her around to obey me. The whole village will laugh at me if they know what I am going through. (21-year old man, SC, six years of schooling, cultivator and tailor; also has a small cloth shop.)

The women had a very different story to tell. A young mother said her husband was not 'understanding', and always got very angry if she said no to sex, even though the baby was very small and she was so tired. A older woman in poor health said that if she refused, her husband hit her, saying who was she planning to sleep with, if not with him. In the extreme, sex within marriage could be very abusive, an expression of control and domination.

> No gruel to drink, I would lay my children beside me and lull them to sleep Then he would come drunk and compel me to sleep with him. I would often be very hungry. Even if I plead he would not listen. One day after sex I almost fainted. That's how I bore my children. My youngest died for want of milk, I had no milk and could not even buy her any, he never gave me any money for that. Even now he is like that. I am nearly 50, I still have to sleep with him. I think I have sinned terribly in an earlier life, to live like this. I have never enjoyed sex. (50-year old woman, non-SC, eight years of schooling, home-based.)

Not all women who passively complied with men's wishes. Some used sex as a bargaining chip to get what they wanted, or, as one women put it, "the only skill we can use".

> These men want us for only one thing... Don't we have rights for other things? When I get angry I get stubborn at night. And then he comes down his high horse and gives in. (22-year old woman; non-SC, 11 years of schooling, TINP teacher.)

Double standards in terms of sexual behaviour are well established. While the woman's physical mobility and association with other men is closely monitored and controlled, several men spoke about their sexual exploits if not after marriage, then "when they were bachelors". Women themselves said that the men had a right to reprimand them "if they went here and there" without their husbands knowledge or consent. And that while it was 'wrong' of men to have extramarital relationships, a clever woman would know how to keep her husband satisfied. "When the food at home is good, no man will want to eat out."

Decisions Related to Childbearing

These include decisions around whether, when and how many children to have; and decisions related to the methods or strategies they would adopt to regulate their fertility. For women in this study, there was no question of choosing 'whether' to have a child. Women were under tremendous pressure to bear a child soon after marriage.

> When I got married, I never thought in terms of controlling the number of children I had. I would pray that I had at least two children growing to adulthood. (30-year old woman, non-SC, five years of schooling, home-based)

If they had not conceived by the end of two years, the women were abused by their parents-in-law and often, husbands as well. It became the responsibility of the women's parents to take their daughters for medical 'check-up'.

> My mother-in-law began to say, "Everyone who married after her has a baby, my poor son is ill-fated. My parents took me to the hospital. I took expensive tonics. Even then I did not become pregnant. Then we turned to traditional medicine, and after one year I conceived. (35-year old woman, SC, no schooling, agricultural wage labourer.)

The men confirmed that it was important to have a baby soon after marriage. According to some, their friends would start doubting their virility if this did not happen. G is a 32-year old cultivator (male), who has been married for 10 years but does not have any children. He is totally preoccupied with this. He kept returning to this issue again and again during the interview.

For the women, the risk associated with any decision to postpone or terminate a pregnancy, or to stop childbearing through use of a permanent method of contraception was extremely high. This was a consequence of relatively high levels of pregnancy wastage and infant and child mortality combined with the high value placed on fertility. Of the 70 women in this study, only 31 had all their pregnancies ending in live births and surviving past childhood. Three women were childless, and the remaining 36 had experienced either miscarriages or stillbirths or lost their children in infancy or childhood. In order to have a few living children, these women had to go through frequent pregnancies at a great cost to their health.

Choosing the timing of their pregnancies was not seen by most women as an option open to them. While the NFHS has shown that there is widespread knowledge in Tamil Nadu of spacing methods, smaller scale studies have indicated that there is a deep distrust of many of these methods. Poor screening and follow-up by the family planning service providers has only confirmed the widespread belief that methods such as the oral pill and the IUD are a health hazard for women.[4]

This was found to be true in this study as well. All but three of the women had chosen not to use a modern method of contraception for spacing, because both oral pills (tablet) and Copper T were considered to be harmful to their health. A number of local examples of women who had suffered from using spacing methods were cited to explain why they thought so. For women whose husbands co-operated – less than a tenth of the women interviewed – 'self-control' was the usual strategy to space pregnancies. This included prolonged periods of abstinence following a delivery, and avoiding sexual intercourse 'during some periods in the menstrual cycle'. For the rest, abortion was the only recourse. Almost a quarter of all women who had ever been pregnant had attempted to terminate a pregnancy. Eight women had had an abortion, two of them more than once.

The decision to adopt a permanent method of birth control cannot be an easy one for women like A, a 30-year old agricultural labourer who had six pregnancies but has only three surviving children.

> I wanted to have the operation after my second son (of the fifth pregnancy) was born. But I had lost 2 children before. So did not. Now I have a small baby, and no one to help even hold the baby. I am thinking seriously about the operation, but am not sure. (30-year old woman, non-SC, no schooling, agricultural wage labourer.)

There are others whose request to have a sterilisation has been turned down because they are in poor health. Clearly, not all women are able to choose to stop childbearing.

About half the women interviewed by us had undergone sterilisation. In the case of four women, the decision was made by their husbands, and the women had no say in the matter. However, the vast majority of them had taken the initiative themselves. Economic necessity and lack of childcare support are strong motivating factors.

> Three months after my third child I had the operation. We were in financial difficulties, my husband does not have regular income and with my first son's poor health I cannot leave him and go out to work. His hospital expenses are also heavy. (28-year old woman, non-SC, eight years of schooling, home-based.)

> Who is to help me if I have too many children ? After this delivery, may be for 2 or 3 days someone in the neighbourhood will bring in food. But after that, I have to sit up and slowly, moving on my seat, begin to do the cooking and housework. For draining the cooked rice, I would call the girl next door for help because I cannot carry heavy weights. I will somehow carry on, from one day to another. What else can I do? (19-year old woman, SC, 10 years of schooling, home-based, pregnant with her second child; cited above.)

The women express a clear sense of entitlement to birth control, but not because they see it as their right to control their fertility but as their prerogative as mothers interested in the well-being of their children.

> What do men know about birth control? They think it is okay to have as many children as are born. It is we women who have to go through the hard times. I think this has to be the woman's decision. (23- year old woman, non-SC, eight years of schooling, home-based.)

This is not to say that husbands, and mothers-in-law do not play an important role in the women's birth control decisions. The men actively discourage their wives' use of spacing methods, but don't use the condom themselves either. They often intervene to postpone women's decision to terminate a pregnancy or to have a sterilisation operation. However, we find that barring a few exceptions, the women give in only up to a point, and then go ahead despite opposition.

M, a 25-year old woman with high school education, was not allowed to have an operation after her second delivery. When she became pregnant soon after, she decided to have an abortion, but her mother-in-law and husband were once again, opposed to it. She went ahead with the abortion and sterilisation all the same.

> I thought, we have two children, what have we done to take good care of them? Why another one? I had abortion and then had operation. They (husband and mother-in-law) settled down after some fights.

It is not only educated and young women who feel so. S is a 35-year old SC agricultural wage labourer. After her third child, she wanted to have the operation but her husband felt that they should have one more son.

> I told him – we are unable to support these three children, we cannot even give them decent food. And you want me to have the fourth? I really gave him a piece of my mind. Then I went ahead on my own. Never asked me anything about it later. He has all these notions – that we need at least two male children, even though we haven't the capability to raise them decently.

Women whose husbands have been ill-treating them and not supported the family financially also feel that it is their right to decide when to stop childbearing. This was the case with P, and L, both agricultural wage labourers, who after four and five pregnancies respectively, decided they had had enough. Accusation by the husband that she was carrying on an affair with another man, made up another woman's mind to go ahead with the operation against her husband's wishes.

Overall, the men we interviewed were in favour of birth control. There were however, differences of opinion between them and their wives on whether to continue a pregnancy and when to stop childbearing. We got a glimpse of the kind of opposition women had to face for 'going ahead anyway' when we spoke to a 30-year old SC agricultural labourer. After four pregnancies and two surviving children – one male and one female, the man's wife had undergone a tubectomy against his wishes. It was her 'thimuru' (arrogance), he said, that made her do this. To teach her a lesson, he had decided to remarry, and the wedding had been fixed.

Gender Power Equations between Married Couples

Divergent views expressed by women and men on the issue of power equations between married couples revealed considerable dissonance and tensions. Women's narratives betray the conflict between prescribed gender roles and changing realities and expectations. Many women saw it fit to enunciate a number of qualifications for a good wife , or a 'good' woman, not necessarily in relation to themselves. She was one who took good care of the house and children. She had to be thrifty; she did not buy things for herself unless her husband asked her to. She did not argue when her husband lost his temper This would maintain the family's peace because " two hands are needed to make a clapping sound" (it takes two to have a quarrel) .

A, who married a man she didn't like, told us how she set out to prove that she was a 'good' woman, and how everyone who thought she would walk out on her husband because she was so beautiful and much younger " were full of praises" that she turned out to be a devoted wife. When we hear what the men have to say on the same subject, it becomes clear that women are echoing male expectations.

> Gossiping with other women, going out with them, all this brings ruin to the family. Wife should save money and make sure nothing escapes outside the four walls of the house. (49-year old man, non-SC, eight years of schooling, water tank operator and mechanic.)

> I wanted my wife to be cultured (nagarigam); know how to entertain people when they come home – speak to them decently, give them something to eat. And she shouldn't answer back when the husband insists on something. (25-year old man, non-SC, seven years of schooling, cultivator and petty-trader.)

> The woman should not spend her time watching movies, dressing up glamourously glittering 'minukkikittu', and carry on with other men. (47-year old man, non-SC, no schooling, cultivator and small-time building contractor.)

Despite women's idealised portrayal of the wife's role, dissatisfaction with the status quo becomes evident as their narratives progressed.

One area of dissatisfaction was men's unwillingness to share housework and childcare. Changing objective realities have made it difficult for women to manage these tasks without help from their husbands. Where there were several women in the household earlier – the mother-in-law, the sister-in-law or co-sister, most women are now by themselves in nuclear families. They do not keep their daughters back at home to help them, like their mothers used to do, but instead, send them to school. There are also greater time pressures: water supply through taps is at particular hours; children have to be ready for school at a particular time; and husbands and they themselves may have to take a bus at a particular time to go out for work

> Even when the baby cries, he does not help me with fetching water. I think men can fetch water, cut vegetables and help manage the children. If the wife is not well, they can do all the household tasks. But he does not do. He says people will say that like a woman he is fetching water (22-year old woman, non-SC, five years of schooling, home-based).

Some women believe that men may be more willing to help at home if the women were also engaged in work outside the home.

> If I also worked alongside him, weeding or transplanting, there will be no fights. But since I am at home, when he comes back from work and I ask for any help with household tasks, he shouts "I work hard and come back, what do you mean, asking me to do this and that?" (35-year old woman, non-SC, five years of schooling, home-based.)

However, discussions with men show that this need not necessarily be true. Men believed that women's agricultural work was not really 'hard work'. Not only older men, but many men in their early twenties took pride in saying that they do nothing around the house, not even clean a 'chatti' (cooking pot) or lift a broom.

The men who 'helped' were few and far between. Their share of domestic work is limited to holding the baby when the wife cooked or fetching water when the wife was unwell. The men we spoke to made it clear that while they may 'help' when the wife could not cope, household work was not and could not be their responsibility.

Men may not change nappies just as yet, but many men do spend more time with older children – getting them ready to school, dropping them off at school, taking them to the doctor, being with them in the evenings. They were also more involved with their children's education. Several young fathers spoke of spending all their free time at home with their children rather than with male friends or in the arrack shops as their fathers used to do.

Another area of conflict between married couples is women's freedom to spend money as they wished.

> In my household everything is as my husband wishes. He thinks that if I have money in hand, I will go away to my mother's house if he shouts or something. So he wants to control. Anything I want to buy, I have to ask him for money or to buy it for me. (22-year old woman, non-SC, 11 years schooling, TINP teacher, cited above.)

> If I ask money for household expenses, a huge battle ensues.(40-year old woman, SC, no schooling, works as 'dhobi' along with her husband.)

The men, on their part, believe that women cannot be trusted to handle money responsibly.

> The woman wants sarees, imitation jewels – how can you let her take decisions about money ? The household will be in debts. (63-year old man, non-SC, four years of schooling, large landowner.)

> My wife gets annoyed when I advise her to cut down on unnecessary 'luxury' expenses on herself. Doesn't worry about how I would find the money to manage the expenses, just makes demands. (29-year old school teacher cited above.)

This 23-year old, high school educated cultivator is all praise for his wife's total financial dependency.

> She never does anything without asking me. Even when she has to buy tooth powder (euphemism for absolute essentials) she will wait for me to buy it for her.

Financial freedom can still be restricted when women are given access to their husband's income – a typical example of access without control.

He gives me all his income. But I cannot buy anything for myself unless he asks me to. He would not like it, and there will be quarrels. (40-year old woman, non-SC, no schooling, agricultural wage labourer, cited above.)

Men have a well-defined notion of what wives may be allowed to do, and the range of decisions they may be permitted to make. Women could be given certain responsibilities, and rights 'up to a point.' It appears that men discussed issues related to the children's upbringing with their wives, and consulted them on matters related to the well-being and interest of 'the family'. Women could also go out in place of the man, to attend weddings or to the market, 'because the man cannot do everything'. Here's a man's very precise definition of what his wife may and may not do.

She may buy things for cooking. As for number of children, she may suggest having fewer, but not more; because it is me who has to provide for the child. Even if I consult her about investments, I need not listen to her opinion. I don't mind if she buys her own sarees, but it must be within the budget I specify, and with my permission. What personal expenses does she have without my knowledge? She should ask me for whatever she wants. But I won't let her go to her natal family, or lend money to her people. I take her there when it is appropriate. No financial transactions with them is allowed. (29-year old school teacher cited above.)

One of most contentious issues seems to be women's freedom to go out on their own, and especially freedom to visit their natal homes. Because women gather support from their parents and brothers in the face of marital conflicts, men prefer to restrict their wives' visits to their natal home.

They say women and men are equal, but that is only in offices. At home men still dominate. Even to visit my mother in the next street, I have to ask his permission (25-year old woman, non-SC, no schooling, home-based.)
Whenever she wants to go out, I go with her. She never goes out with her relatives or women in the neighbourhood, that's the way it should be. (35-year old man, SC, four years of schooling, agricultural age labourer, has worked as construction worker in Delhi for many years before his marriage.)
One day, she got word that her uncle had died, and she had to go. I was not at home. She waited at home, crying, till I returned in the evening. Then I took her. (23-year old man, non-SC, nine years of schooling, cultivator.)

Women from some traditionally labouring but now upwardly mobile castes are finding their entry into workforce restricted by their husbands.

He says, why do you have to go to work? I am earning. We don't need your money for eating two meals a day. I say, isn't it good if both of us earn? Even if you don't find work, I could still bring in money. He gets angry when I say this. If we have conflicts, they centre mainly around this. (29-year old woman, SC-Christian, seven years of schooling, agricultural wage labourer.)

In yet another instance, the newly married wife who was working in a hosiery factory in the local town found herself playing housewife after a marrying into a village-based family. There was a tug-of-war going on, with her insisting on their moving to the town and working together in the factory, and his refusing to leave the village.

Men in this study felt that when compared to their own fathers, they were treating their wives very well, and permitting them a great deal of 'rights' ('urimai'). Giving in to women's demands for a greater say in the affairs of the home was perceived as loss of control. Several young men lamented that "the world was turning upside down"; that these days, 'women commanded and men obeyed' and that women ruled the roost. Women, on the other hand, are acutely aware of their lack of decision-making power within the household.

If I tell him, go for this job, don't go for that, he says, who are you to tell me what I should and shouldn't do ? A man who listens to a woman will never prosper. (29-year old SC-Christian woman cited above.)
All decisions in the family he alone takes, my role is restricted to cooking, kitchen (30-year old woman, non-SC, 10 years of schooling, home-based.)
We have no decision-making power in the household; they will consult us but do as they please. If what we say is at contrary to what they think, they will never take it (into account). "Is it my will and pleasure, or yours? Should I listen to a 'pottachi' "? (they would say) (38-year old woman, non-SC, five years of schooling, home-based.)

Mechanisms of Control Over Women

Non-adherence to prescribed codes of behaviour was almost always reprimanded, often with physical force (hitting and slapping). Even those women who perceived their relationships to be generally problem free spoke of being shouted at or beaten because the food was not cooked on time or was not tasty; the cow had wandered off; she had stayed for too long at the well chatting with neighbours; the child was

crying unattended, etc. The men's accounts confirm this:

> Once when I came back from work, she had not fetched water and kept it boiling and ready for my bath. So I was angry and hit her. She retorted, saying she had also just come back from work. (27-year old man, SC, five years of schooling, agricultural wage labourer.)
>
> I have beaten her many times. When she goes out without my permission; when she does not take care of my parents properly; if the food is not ready when I come back from work; when the water is not kept ready and boiling (for my bath) when I return; if the children are not kept clean and "decently" dressed. (55-year old man, non-SC, no schooling, agricultural wage labourer.)
>
> Once when I asked her to heat water for my bath, she was sitting in the neighbour's house watching TV and gossiping. I had to hit her. (25-year old man, non-SC, seven years of schooling, cultivator and business.)

Some statements make one wonder if it was not more than an issue of irritation and annoyance with a job not well done. For example, this man from the Pallar (SC) community believed in hitting his working wife as a means of keeping her subdued and under control:

> Because she comes to work alongside me, and comes back with me, there won't be much respect. She will not bow to my wishes. So one has to beat, to make her tow the line.

Another, much more powerful weapon used by men to keep women in tow is to throw aspersions on their morality. 'Sandeham' – doubts about the woman's sexual loyalty on the part of the husband, if not immediately quelled, can mean social ostracisation. In fact, while there would usually be support from parents and brothers in case of ill-treatment from husbands, once it has to do with a woman's morality, the woman loses all sympathy because she has brought dishonour to her natal family. Two women in this study had been victimised thus by their husbands and had been ostracised by their natal families.

While practically all the women had been beaten at one time or another, a third of the women were victims of violence perpetrated regularly and systematically by their husbands. This was not restricted to any particular social group and was found both among the educated and uneducated women, and among those who were gainfully employed as well as those who were housewives.

> He tortures me bit by bit. I should not answer back for anything. Should never leave the house, do all the work. If he sees me sitting even for a moment, he would say, "why are your sitting on your ass like this and getting fat?" So I have to get up and go away as soon as I see him entering the house, and keep standing or working. If not, I will be beaten. Even now I haven't got any guts. I have a son and daughter married, and still. (50-year old woman, non-SC, eight years of schooling, home-based, wife of a rich landowner.)

Most battered women stay on because they have no place to go.

> Every day passes in fear. If I dare talk back I will get beaten more. I have now learnt to keep my mouth shut. Where will I go if he throws me out ? Over the past few months I have gone close to taking poison three or four times. Then I think of the children. Who will take care of them if I die? (25-year old woman, non-SC, no schooling, petty vendor, cited above.)

And others hold on in the hope that when their children grow up, their lives will be better.

> He was much worse before, but slowly I have begun to retort. I will bring him in tow someday. When my children grow up and begin to earn, then he will know his place. (35-year old woman, non-SC, no schooling, agricultural wage labourer.)

From women's descriptions of their childhood, it appears that male violence was probably more widespread in their mothers' generation. Women who had had violent fathers or had witnessed violence in marital relationships had a strong sense of the injustice of the situation. It is important to note that women in the present study did not accept systematic male violence as their fate. They speak out against it, and have in their daily lives fought back in a number of ways, walking out on the marriage if they possibly could.

> If a husband treats you badly, I think we are not obliged to put up with it. A woman can manage on her own. The only problem is, women are afraid of what people will say. Only women who are bold have good lives, good husbands. Those who are calm, patient, they suffer most. (22-year old woman, non-SC, five years of schooling, home based.)
>
> If we behave like cowards they will treat us worse; we will lose all self-respect. We should stay put and fight back (28-year old woman, SC, five years of schooling, agricultural wage labourer.)
>
> No man should beat a woman, these days women don't allow this. For 25 years I have been separated, I have stood on my own and proved that I can survive, my daughter is happily married. (45-year old woman, non-SC, Christian, no schooling, cultivator.)

Women's Public Faces

More women in Tamil Nadu today have the opportunity for public participation, as teachers and helpers in the Tamil Nadu Integrated Nutrition Programme (TINP), as leaders and participants in local women's associations, and as members of political parties. Five of the women in this study worked in the TINP, seven were participants in local women's groups, and three were leaders of local women's wings of political parties – AIADMK, Congress and CPI(M), respectively.

Two of the women politicians had married men not chosen by their parents 'to uphold their honour'; disappointed in marriage; abused and accused of sexual immorality by their husbands. While they continued to remain married "so as not to confirm these accusations", they appear to have been freed from the yoke of proving to be a 'good' woman.

There were powerful accounts from women of incidents where they challenged their exclusion from the public space; and of feeling empowered through their participation in women's groups. It is perhaps the inspiration and strength drawn from these experiences that echo within the confines of their homes.

> The caste panchayat met to settle (case of a young woman who complained of ill-treatment from her husband) the issue. The man's people came with a lawyer from the town. Usually there are no women allowed to attend the caste panchayat. But I gathered a group of women and went to the meeting. The lawyer said, "who allowed the women to come to this meeting?" And I retorted that when women were allowed to appear in the court of law, and even act as lawyers and judges, what prevented us from attending this hearing? All the women supported me. Now more women are daring (AIADMK secretary).

IV

The picture which emerges from the experiences of women and men in this study is quite complex. On the one hand, women are aware of their right to be treated as individuals in their own right. Attitudes to women's education and employment are positive, and women are consulted in family matters more than before. On the other, negative forces such as dowry demands are on the rise, even among castes that traditionally paid bride prices. Yet again, while women have decision-making powers in some areas, they are denied fundamental autonomy, especially in the personal, or 'private' sphere.

Women can play significant roles in the community and yet not have a say in matters related to control over their sexuality and reproduction. They could be managing household finances without having the freedom to spend money on themselves or on their natal family. And while their physical mobility is not usually restricted in terms of not being able to step outside the house, they rarely have the freedom to move around without their husbands' knowledge and consent, even if it is in the company of other women.

Women are 'allowed' to move forward in areas that would help them become better mothers, wives and housekeepers. Women's education and supplementary income is in fact crucial to the modern day young men's aspirations for upward mobility through better investment in the children. However, nothing that would dislodge the male authority and cause imbalance in the current gender power equation, is tolerated. Any transgression of these 'male-determined' codes of conduct runs the risk of retaliation with physical violence and battering. A woman respondent aptly summed up the improved status of women without fundamental autonomy, in the following words: "The circle (in which women are enclosed) has grown bigger. But is still the men who draw it and decide how big it should be".

Although women are dissatisfied with their situation, they are still far away from challenging gender ideology which supports male authority and control. Their demands are more modest: they want a say in who they will marry, and how many children they will have and when. They would like greater personal freedom, and to be consulted in household matters. They expect greater consideration and benevolence from the men. For many, even this is a lot to ask for, and their expectations remain limited to freedom from violence and abuse, and financial support to the family. To conclude with the words of Thiruchandran (1997),

> Despite the fact that there were elements of protest by women which betrayed their deeply felt emotional and physical deprivation, a total rejection of the patriarchal culture manifested itself only among a very few women.

All the same, the fact that voices of protest are being heard from older and middle aged women is significant, because they may be expected to socialise their daughters to challenge the status quo. As more women begin to reject patriarchal culture, tensions and conflicts between the sexes are likely to get further accentuated.

Notes

[Data used in this paper were collected as part of the study on fertility transition in Tamil Nadu carried out under the aegis of the 'Project on Strategies and Financing for Human Development', Tiruvananthapuram, and funded by UNDP I owe a great deal to the women and men who shared their life stories with us, and to the commitment of the research team.]

Fiscal Deficits, Expectations and Exchange Rates

Errol D'Souza

Fiscal deficits that are expected to be reversed at some unknown date in the future cause a real appreciation of the exchange rate along with an expectation of depreciation, a trade deficit, and high domestic interest rates. The expectation of depreciation will have a positive impact on investment provided a time-frame within which the deficit can be credibly reduced is charted and acted on.

STARTING with the *Economic Survey 1998-99* there has been much mention made of the second generation of reforms required to avert a possible fiscal and external sector crisis in the medium term. The *Economic Survey* had called for a sharp reduction in the fiscal deficit, containing subsidies, cuts in interest rates, and the liberalisation of trade in agriculture amongst other measures. The *Survey* had also called for a pragmatic and flexible exchange rate policy to ensure exports remain competitive and had generated uncertainty about a depreciation in the external value of the rupee. The *Survey* had stated that the "fiscal deficit is the key parameter of macro-economic policy, which has profound implications for inflation, interest rates, investment, growth, the financial system, balance of payments and last, but by no means least, overall credibility of government's macro-economic policy...It is therefore essential to put the fiscal deficit on an irreversible and unambiguously declining trend." This was followed up in the budget speech with the finance minister placing the process of revenue and fiscal deficit reduction as the top priority in his six-point strategic agenda. The subsequent monetary policy announcement by the Reserve Bank of India also factored in a possible fiscal improvement. The slashing of the repurchase rate, the trimming of the cash reserve ratio, and the cutting of the bank rate all signalled interest rate reductions in line with a projected reduction in the fiscal deficit.

Subsequently, there has been some questioning as to whether the reduced fiscal deficit that has been budgeted is due to the GDP base year having been forwarded to 1993-94 and/or due to small savings collections accruing to the states being excluded from the centre's fiscal deficit. It is true that the changed base year of GDP has given a facelift to the state of the economy and a full 1 per cent point of the revised growth of 1997-98 is attributed to the pay increases to the bureaucracy. It is also true, however, that if three-fourths of small savings go to the states as long-term loans, then, these are borrowings by the states and should not be reflected in the centre's fiscal deficit. Subtracting out the states' share of small savings from the receipts and expenditure side of the capital accounts in the budget whilst showing the centre's share of small savings as a capital receipt will definitely reduce the fiscal deficit of the centre though it will keep the combined deficit of the centre and states unchanged. However, for completeness interest receipts on account of small savings loans given to state governments should also be removed from the revenue account of the budget under the 'interest receipts, dividends, and profits' head of non-tax revenue receipts. From a perusal of the receipts budget it turns out that this has not been done and so the total receipts of the centre have been inflated which has consequences for the true value of the centre's fiscal deficit.

The fiscal accounts of the central government for the decade of the nineties have been worked out in the table by excluding the states' share of small savings loans from capital receipts and expenditures and all relevant ratios of variables to GDP are with reference to the revised 1993-94 GDP series. The fiscal deficit which was a high 6.3 per cent of GDP in 1993-94, gradually reduced till 4 per cent in 1996-97 before going up again to 4.7 per cent of GDP in 1997-98. In the year 1999-2000 it is budgeted to be 4 per cent of GDP again. This is sought to be achieved mainly through a slight reduction in the central government's expenditure programme from 14.5 per cent of GDP in 1998-99 to 14.2 per cent of GDP in 1999-2000, and an increase in direct and indirect taxes (as a result of rationalisations of union excises and the surcharges on direct and indirect taxes) from 6.2 per cent of GDP in 1998-99 to 6.6 per cent of GDP in 1999-2000. The increased revenues have been estimated on the assumption that the economy will grow by 7 per cent this fiscal year. This step up of the growth rate are expected to occur due to agricultural growth and a housing boom which will lead to industrial recovery. Also, additional savings are expected to be mobilised through the tax incentives given to equity mutual funds and the reduction in long-term capital-gains tax which is expected to revive the stock market and give a fillip to investment.

There is much uncertainty as to the efficacy of these measures. As part of the new policy in agriculture, in order to minimise leakages, funds will flow directly from the centre to the gram panchayats, grants will be conditional on states implementing reforms (for example, funds earmarked for the accelerated irrigation benefit programme will only be provided if states rationalise their water rates), and there are a number of initiatives to improve bank credit deployment to the agricultural sector (Rural Infrastructure Development Fund, Kisan Credit Cards, promotion of Self Help Groups, etc). Many of these have long-term impacts which are favourable but the immediate impact on agricultural growth is marginal. However, the real constraint to agricultural growth lies in non-price factors such as technology and infrastructure-led government investment [Desai and D'Souza 1998]. The constraints on agricultural growth lie in improving total factor productivity which is a function of agricultural research and investments in agricultural infrastructure. Hence, the measures outlined in the budget for agriculture though important, will not have the growth impact that is visualised.

In the housing sector, the interest on loans for self-occupied property has been made tax exempt up to Rs 75,000, up from Rs 30,000 earlier, housing projects under Section 80IA of the Income Tax Act have been given a tax holiday, and business investment in new housing for employees can be treated to 40 per cent depreciation unlike 20 per cent earlier. The demand for

housing is usually sensitive to interest rates. Conceptually, the rental price of housing would equal the interest rate plus a rate of depreciation times the price of a house. As houses depreciate very slowly unlike business investments, the interest rate is a large fraction of the rental cost of housing and the demand for housing investment is therefore sensitive to interest rates. Also, as with deregulation the price of housing is expected to decline, any investment now can be expected to earn a capital loss for which compensation in the form of higher rentals on housing will be necessary for investments in housing to break even. Hence, housing investment will depend more on interest rate reductions on housing loans and expected capital losses associated with deregulation of the real estate market rather than on tax exemptions. Investment in housing also usually follows an accelerator type principle and is related to the change in real income. The pick up in housing sector projects will thus be sensitive to actual income growth in the economy, expected declines in the pricing of accommodation, and the interest rates prevailing and it is unknown whether housing investments will firm up or not.

In the capital market the two tax initiatives of exempting from income tax all income from mutual funds received in the hands of investors and exemption from dividend taxes for mutual funds with more than 50 per cent investment in equity it is hoped will revive the capital markets. This does not address the major problem in reviving the capital markets, namely, lack of investor confidence. The initial euphoria of 1991-94 about stock markets has subsided as a large number of the companies floated then are no longer in existence and cannot be traced [Gupta 1998]. Also, as noted by the Shankar Acharya Committee on the Primary Market most corporates enjoy little credibility with investors which is a reason for poor demand for corporate securities. As Indian stock markets perform the role of monitoring corporate management very inefficiently, it is subjecting corporate managements to shareholder discipline that is the priority capital market reform. Ensuring good corporate governance is something that does not bother the regulatory authorities such as SEBI or the stock exchanges and so unless some other body such as the CII takes this up on a priority basis investors are not going to be drawn back to the capital market. The finance minister recognised in his budget speech that companies should "put their houses in order by following internationally accepted practices of corporate governance" but all that he has done to help this happen is to institute a national award for excellence in corporate governance. Capital market revival may not take place accordingly and that implies that this third strategic policy component may also not be successful in reviving growth in the economy.

The growth stimulants envisaged by the budget of revival of the rural sector, a package to boost housing sector activity, and getting the stock market moving through tax benefits for savings in equity will thus have a limited impact on reviving the economy. If growth does not take place as envisaged, then, the revenue receipts of the government will be affected and the fiscal deficit will balloon. From the table we can see that tax revenues are scheduled to finance 46.6 per cent of central government expenditure, up from 42.4 per cent last year. This increased revenue is going to come from union excise duties, customs, and personal income taxes. Even though the reduction in the number of excise slabs will reduce transactions costs and improve efficiency, the accompanying surcharges will dilute some of the short-run gains. Also, even when industrial growth was at its peak, as in 1995-96, union excise revenues accruing to the central government grew by just 5.1 per cent and in the previous year, 1994-95, when industrial growth was good, union excise revenues to the central government grew by 20.1 per cent. This year when there are doubts about good industrial performance they have been budgeted to grow by 24.2 per cent which is an overestimate. Also, higher direct taxes on assessees will affect the demand generation process adversely and with world trade growth declining as well as the prospects of good domestic growth being uncertain, it is unlikely that customs revenues will grow 16.6 per cent as envisaged. The last two major spikes in customs revenue collections came in 1995-96 (28.9 per cent growth) and 1996-97 (18.1 per cent growth), mainly due to the high imports that accompanied industrial growth as well as the depreciating external value of the rupee. The tax-GDP ratio of the centre from 1990-91 to 1998-99 works out to an average 6.6 per cent as against the 8.3 per cent in the eighties. As the table reveals the tax-GDP ratio has been declining in the nineties. All this points to the fiscal deficit being under pressure in the current year.

Thus, even though a reduction in the fiscal deficit has received top priority in this budget there is a lot of uncertainty as to whether and when it will materialise. It is widely known that continuing fiscal expansion cannot continue indefinitely due to the consequences of large debt accumulation and so an expectation has been generated in the economy of a fiscal correction. The uncertainty is as to when it will occur. Accordingly , to understand the impact of fiscal deficits on the economy, we need to discuss the role of expectations and how expectations of future fiscal policy have effects on aggregate demand. Expectations about the future course of fiscal policy affect demand today through adjustments in asset markets as portfolio decisions factor in the news about tomorrow's changes today. There are thus two aspects of fiscal deficits which are

ignored when discussions as to their impact effects take place and these two aspects are crucial to understanding the current trajectory of the economy. One is expectations generated by the uncertainty regarding when the fiscal deficit will be reduced. The second is that the speed of adjustment in asset markets is typically faster than the speed of adjustment in goods markets and thus fiscal actions which are anticipated to occur in the future will affect the current state of asset markets and hence affect aggregate demand even before the fiscal changes are actually implemented. The Dornbusch (1976) model is ideally suited to address these sorts of issues and we first set out the basics of this model before adapting it to the case where there is uncertainty as to when a fiscal expansion programme will be corrected.

Sticky Prices, Deficits and Exchange Rates

The Dornbusch (1976) model is the workhorse of open economy macro-economics where there is rapid asset market or interest rate and exchange rate adjustment due to perfect foresight in asset markets and sluggish price adjustment in the goods market. Since it is an open economy model, in addition to the standard factors determining domestic demand such as interest rates and income, external demand or the demand for net exports is influenced by the competitiveness of domestic relative to foreign output. Relative competitiveness can be measured by the real exchange rate, $Q = EP^*/P$, where, P (P^*) is the price of domestic (foreign) goods and E is the price of a unit of foreign currency, measured in units of the domestic currency (the rupee/dollar exchange rate). The greater is Q, the more competitive will be domestic output and so higher levels of Q would make the trade deficit smaller than would lower levels. Taking into account the competitiveness of domestic output, the goods market equilibrium condition – the IS curve – will be given by the following equation where the foreign price P^* has been set at unity and all variables except the interest rate are in logarithms and so the lower cases of the corresponding higher case letters

$$y = h(e - p) + \alpha(r - p) + g \qquad ...(1)$$

In (1), y is aggregate demand, r the interest rate on bonds, g is an index of the government's fiscal deficit, and p is the rate of inflation. The parameter h is positive whilst α is negative. The equilibrium relationship has been solved for income so that the effect of consumption expenditure has been implicitly included in the equation. Financial markets are treated as adjusting instantaneously with investors being risk neutral so that uncovered interest rate parity holds at all times.[1] This implies that expected depreciation is just great enough to offset any interest rate differential between the domestic economy and the rest of the world and the asset market equilibrium condition is:

$$r = r^* + \Delta e^e \qquad ...(2)$$

where, r^* is the exogenously given interest rate abroad and Δe^e is the expected depreciation in the value of the rupee relative to the dollar.

Following Dornbusch (1976) model the exchange rate is assumed to be at its equilibrium level only in the long-run and in the short-run it will deviate from its equilibrium level as a result of the sluggishness

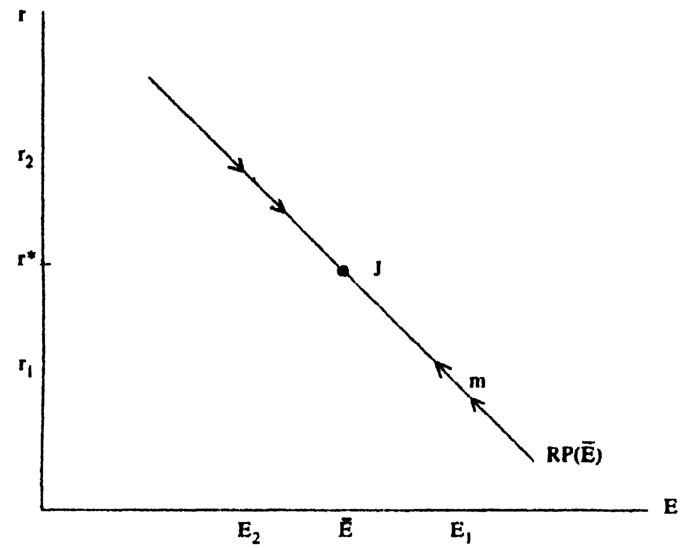
Figure 1



with which goods prices react to a disturbance. Dornbusch argues that when the exchange rate is below its long-run equilibrium level there will be a natural presumption that its future path will carry it upward in the direction of equilibrium, rather than downward and away from equilibrium and vice versa when it is above equilibrium. Formally, this assumption implies that the expected depreciation relative to the current level of the exchange rate, $(E^e - E)/E$, will equal the gap between the equilibrium exchange rate and its actual levels, $(\bar{E} - E)/E$, raised to the power of θ, i e,

$$\frac{E^e - E}{E} = \left(\frac{\bar{E} - E}{E}\right)^{\theta}$$

Taking logarithms, $\Delta e^e = \theta(\bar{e} - e)$ ...(3)

where, θ reflects the sensitivity of market expectations to the proportionate under or overvaluation of the exchange rate. This mechanism is illustrated in Figure 1.

Suppose initially we are in equilibrium at point J, with an exchange rate of $\bar{E}$, the domestic interest rate equal to the foreign interest rate r^*, and hence with the exchange rate expected to remain unchanged. If for some reason the domestic interest rate were to fall to r_1, we know from (2) that it could only occur if agents were convinced that the rupee would appreciate against the dollar over time so as to compensate for the lower explicit interest paid on domestic securities. Hence, the rupee's value would have to be below its long-run level so as to generate the expectation of a future rupee appreciation as it moves back towards equilibrium. The system will thus settle in the short-run at a point like m where the exchange rate is E_1. Conversely, when the domestic interest rate is relatively high, the market will be anticipating a fall in the value of the rupee as otherwise domestic assets will be attractive relative to those denominated in the foreign currency. In the short-run if the domestic interest rate were to rise to r_2, the rupee will appreciate to E_2 with the expectation that over time it will return to its equilibrium level at point J. Hence, for the given long-run equilibrium exchange rate $\bar{E}$, there is a line – RP in Figure 1 – that slopes downwards from left to right which plots the feasible combinations of r and E, consistent with short-run equilibrium. Along RP, the rupee will be appreciating at points below the horizontal line through r^*, or depreciating, at points above r^*.

Deviations from the equilibrium exchange rate arise because the price level is sticky – the aggregate supply curve is horizontal in the short run. In the short run the price level is fixed due to rigidities in the goods and labour markets such as due to long-term contracts and lack of information. Thus, shocks that affect the nominal exchange rate will result in changes in the real exchange rate and will be associated with current account deficits or surpluses. Suppose the trade balance clears at the real exchange rate $\bar{Q} = EP^*/P$. Figure 2(c) plots this relationship for a given value of foreign prices, P^*. At combinations of P and E above the $\bar{Q}$ line, the rupee's real value is higher than $\bar{Q}$, so that the domestic economy is uncompetitive and hence runs a trade deficit, and vice versa below the line.

Money market equilibrium is characterised by the LM curve whose equation is:

$$m - p = \kappa y - \lambda r \qquad ...(4)$$

Finally, there is a demand adjustment equation which states that the wider the gap between demand and capacity output $\bar{y}$, the higher the rate of inflation,

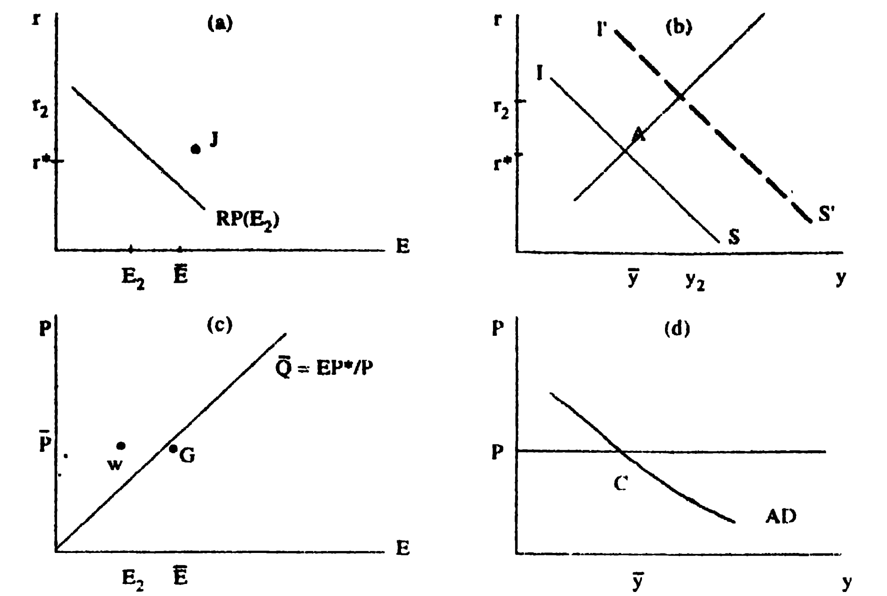
$$p = \pi(y - \bar{y}) \qquad ...(5)$$

If demand deviates from $\bar{y}$, there is a protracted change in the level of prices in the economy. The long-run equilibrium will be characterised by an equality of aggregate demand and supply so that there is no pressure on the price level and an equality of domestic and foreign interest rates so that the exchange rate is static with no expectations of appreciation or depreciation. Drawing the IS curve – equation (1) – and the LM curve – equation (4) – in Figure 2(b), and the aggregate demand and supply curves in Figure 2(d), we can see that the initial long-run equilibrium is attained at the points J, G, C, and A in Figure 2.

Now, suppose there is an expansionary fiscal policy which causes the IS curve to shift to I'S'. This increased government expenditure financed by additional borrowing is only possible at the cost of a higher interest rate given a fixed money stock and constant price level. The impact effect is to raise income to Y_2 and the interest rate to r_2. However, a higher interest rate implies an influx of funds which means an emerging excess demand for rupees and the exchange rate must appreciate. Also, as the exchange rate rises domestic goods become less attractive to foreigners and there will emerge a trade deficit.

As prices respond to excess demand the real exchange rate appreciates further, causing the trade balance to deteriorate further and the I'S' curve shifts back down to the left, pushing the interest rate some of the way back to its pre-expansion level. The long-run impact, however, is for a return to the original income-interest rate combination as given at point A. In terms of the money market, with the long-run interest rate pegged by external factors $(r = r^*)$, and the long-run capacity output given $(Y = \bar{Y})$, a fixed money stock implies a unique level of prices consistent with equilibrium given by $P = \bar{P}$. For long-run equilibrium the exchange rate must therefore have moved so as to keep the IS curve unchanged, i e, enough to offset the expansionary effect on demand of the increase in government spending. The whole of the increase in government expenditure is neutralised by the consequent equal fall in demand from the external sector of the economy – crowding out is complete. The burden of adjustment thus falls entirely on the exchange rate which appreciates by

FIGURE 2



enough so as to generate a trade deficit as great as the increase in fiscal spending that started the process off – the impact of fiscal spending on output is nil.

Given perfect foresight and that financial markets clear at all times, agents in the economy form their view as to where the exchange rate is going to end up as a result of the fiscal shock. They will judge that the long-run equilibrium exchange rate is going to be E_2. This appreciation of the exchange rate will sustain a trade deficit represented by point w in Figure 2(c) that exactly offsets the increased government spending. The long-run equilibrium exchange rate will be E_2 and the combination of r and E consistent with short-run equilibrium is given by the downward sloping RP(E_2) curve through the point (r*, E_2). The short-run equilibrium is the long-run equilibrium as well due to the price level remaining unchanged in the long-run as argued above. Hence, a permanent increase in government spending causes an immediate once and for all appreciation of the exchange rate, and complete crowding out of the increased government spending through reduced net exports. As prices do not change there are no dynamics to this system.

Reversal of Fiscal Deficits

Given this framework we now analyse the effects of an increase in government spending which is expected to be reversed at an unknown date in the future. Agents realise that large deficits cannot be expected to continue indefinitely and so expect a policy change of fiscal correction. They are uncertain, however, as to the timing of the fiscal correction. Whenever the expansionary fiscal policy is reversed, the exchange rate will depreciate, and this will result in a capital loss on domestic assets. Given equalised yields, domestic asset holders must be compensated for this prospective capital loss. This requires that the domestic interest rate no longer exceeds the foreign interest rate by just the expected rate of exchange rate depreciation. The domestic-foreign interest rate gap now equals the rate of exchange rate depreciation plus the capital loss which would occur when fiscal correction occurs, multiplied by the probability of fiscal correction. Let the probability of fiscal correction be δ Then,[2] (2) will be replaced by

$$r = r^* + \Delta e^e + \delta(\tilde{e}_t - e_t) \qquad \ldots(6)$$

where, $\tilde{e}_t$ is the exchange rate which would be reached instantaneously when fiscal correction occurs.[3] $\tilde{e}_t$ is not a long-run exchange rate but rather the rate to which the exchange rate jumps following a policy reversal.

The impact of a fiscal expansion that is expected to be reversed at some unknown date in the future can now be spelt out. The fiscal expansion causes the appreciation of the exchange rate and the domestic interest rate rises as well. The rise in the interest rate requires the price level to rise so as to equilibrate the money market. The excess demand causes the price to rise and as a result, further real appreciation occurs. Hence, there is persistent exchange rate appreciation. However, given the possibility of a fiscal policy reversal at some unknown date in the future there is an anticipation of a depreciation and so the exchange rate does not appreciate as much as it would have had there been a permanent increase in spending. With a policy reversal the exchange rate must depreciate eventually to Ē. Hence, the relevant short-run (r, E) relationship will be the RP(Ē) curve parallel to RP(E_2) and passing through the point J. This would imply that for $r = r_2$, the relevant short-run exchange rate will lie somewhere in between Ē and E_2, i e, the exchange rate appreciation is not as pronounced as in the permanent government spending case due to the uncertainty regarding policy reversal.

An appreciation of the exchange rate and a deterioration of the terms of trade as domestic prices rise together ensure a trade account deficit in the temporary equilibrium where the government deficit has been raised. In response to the fiscal expansion output would initially rise but as domestic prices rise it would revert back to its original level and the trade deficit will thus become larger or smaller over time as prices adjust. The uncertainty about future fiscal correction thus results in the simultaneous existence of a sustained exchange rate appreciation and an expectation of depreciation. It also results in high domestic interest rates and a trade account deficit. The mechanism outlined here is able to explain how it is possible to have a phenomenon of exchange rate overvaluation and expected depreciation. The phenomenon is not due to any exchange rate management on the part of the central bank but due to uncertainty regarding the time path of reducing a large fiscal deficit.

The expectation that there will be a future fiscal contraction as well as depreciation of the exchange rate implies two things – net exports will receive a stimulus (other things such as the growth of global GDP unchanged), and a perception that interest rates are going to decline. With the anticipation of lower interest rates and a decline in the cost of capital in the future there is a spur to private spending on investment. The expectations effect brings forward the future expected interest rate decline to affect investment spending today. Even though output will decline in response to a decline in government expenditure, aggregate demand will receive a stimulus from a depreciation of the real exchange rate. The increased net exports will get reflected in a rise in profits and that in turn will affect investment positively. Hence, we can expect to see private investment spending increase today due to an anticipation of a declining cost of capital and an increase in profits earned in the external sector. It is quite possible that the capital goods sector which is the

only industrial sub-sector to show respectable growth currently is responding to these effects. For a continuation of this performance interest rates must fall as expected and the fiscal deficit reduced so that private corporate investment continues to expand.

There has been much discussion as to how the rupee has been overvalued and that a depreciation would be good for exports. It is often pointed out that the cumulative depreciation of the rupee since the onset of the east Asian crisis in July 1997 has been about 15.7 per cent by end January, 1999, as against a depreciation of 73.4 per cent of the Indonesian rupiah, 33.6 per cent of the Malaysian ringgit, 24.4 per cent of the S Korean won, and 29.9 per cent of the Thai baht. Such large depreciation of these other currencies it is argued has affected the price competitiveness of our exports. However, tampering with the exchange rate and steering a depreciation will be a very wrong policy move at this time. When the fiscal deficit in India is high compared to that in east Asian countries, it is to be expected on the basis of the arguments outlined above that the Indian exchange rate will be overvalued relative to other currencies. Instead of calling for a depreciation of the exchange rate, a clearly spelt out and credibly implemented programme of fiscal correction is the appropriate policy change that must be aimed for. As liberalisation of the economy has proceeded, the interest rate and exchange rate channels have become active in the macro-economic transmission process and policy must be sensitive to this emerging scenario.

Conclusions

The fiscal deficit has attracted a lot attention in economic policy-making. Whether small savings loans to state governments are included whilst measuring the deficit or not, most analysts are of the view that the deficit is large and needs to be reduced. Given the declining tax revenue-GDP ratios, the paucity of funds raised through disinvestment, and the growing government expenditures on administration, subsidies, and interest payments, there is a lot of uncertainty about when it will be possible to make the borrowings arising from the deficit sustainable.

A fiscal deficit which will be reduced at some unknown date in the future causes a real appreciation of the exchange rate with an expectation of depreciation, a trade account deficit, and high domestic interest rates relative to those prevailing abroad. As a result of the exchange rate appreciation net exports decline. It is therefore important and about time that policy clearly spells out the method of reducing the fiscal deficit and a time-frame within which it will be attempted. This obviously calls for expenditure management in a big way. This obviously calls for expenditure management in a big way. The role of the Expenditure Reforms Commission that this budget proposes to set up is therefore central to successful economic policy-making. Such a commission will face a very difficult task as when some expenditure is to be reduced some interest that is represented in the agenda of a political party will be affected and that will take it hard to attain a consensus. With a coalition of political parties sharing power the veto is a credible blocking strategy when some interest is threatened and that makes expenditure compression difficult. It is much easier to have consensus on taxation especially when tax rates are to be reduced as in such a situation everyone gains in absolute terms.

The gains to establishing a course of fiscal reduction is that one a course for fiscal correction is charted and it is adhered to, it will contribute to the stability of expectations in the economy and impinge on interest rates and exchange rates in a more predictable manner and allow a more efficient level of economic growth.

Notes

1 The model's assumption of perfect capital mobility can be swapped for one of imperfect capital mobility such as characterises semi-open economies [Edwards and Khan 1985] This added realism does no damage to the conclusions and so only the simpler case is discussed here of perfect capital mobility.

2 Formally, let the instantaneous probability of a fiscal correction be δ. Let $\tilde{e}_{t+h}$ denote the exchange rate at time t + h if a fiscal correction occurs during the interval h. Then, given the exogenous probability δ of a regime change in fiscal policy, the expected rate of change of the exchange rate over the interval of length h is $(e_{t+h} - e_t)(1 - \delta h) + (\tilde{e}_{t+h} - e_t)\delta h$. If we make the time interval instantaneous, i e, dividing throughout by h and taking the limit as $h \to 0$, then, this expression for the interest rate differential reduces to that given in equation (6).

3 The value of $\tilde{e}_t$ is given by the solution for the exchange rate that will put the system on the saddlepath for a given price level and for $g = 0$.

Emerging Patterns of Urban Growth in India

Annapurna Shaw

A study of investment in India's metropolitan cities (cities with million-plus population) and their neighbourhoods during the nineties indicates the emergence of urban cores of high investment and the virtual bypassing of the remaining metropolises by liberalisation-fostered growth. As the growth patterns of the 23 metropolises tend to reflect the state of the economies of their respective regions, this bespeaks the widening of interregional economic disparities.

FOR much of this century the Indian urban system was dominated by four metropolitan cities: Mumbai (Bombay), Delhi, Calcutta and Chennai (Madras). Each served as a regional capital and acted as a central place for a vast rural hinterland. Since the sixties, these four cities have grown both in population and in the size of their metropolitan areas. While their regional importance continues unabated, they have now to contend with the emergence of other centres of urban growth; smaller metropolitan cities such as Bangalore, Hyderabad and Pune. The opening up of the Indian economy since 1991 has stimulated the development of such cities and led to the creation of new hubs of urban growth centred on the manufacture of computer software, electronics and related sunrise industries. It has also had a differential impact on the four dominant cities of the past.

While Delhi remains important nationally as the seat of administrative power, Mumbai, the country's financial centre, has experienced rapid growth and is aspiring to become a global city. The processes of centralisation and concentration of finance and related services in Mumbai are discernible and they are leading to a restructuring of land uses and jobs in its business district. Calcutta and Chennai continue to remain cities of the first rank in their regional contexts, but nationally the importance of the former as a centre of business and industry is falling. Calcutta in fact has experienced a continued industrial decline since the 1960s and the movement outwards of major private sector companies continues.

The changing fortunes of these cities make more sense when viewed in a regional context. Each of the four largest Indian cities is located in a different region of the country. These regions saw differential rates of growth during the 40 years prior to economic liberalisation in 1991, but the opening up process since then has clearly heightened the pace of differentiation. Liberalisation has affected regions directly through the reduced involvement of the central government in the economic management of the states. The states are now freer to pursue their own economic goals, and some states are proving to be far better at this than others.

The result is that the distance between the states doing well and those doing badly has been widening since 1991, and the weak states are being left far behind. Metropolitan cities located in weak states/regions have inevitably grown slower than those in the more dynamic regions. Calcutta's location in the eastern region, the poorest part of the country, can explain in part its lack of attractiveness to new business and investment.

In this paper, I examine the newly emerging patterns of urban growth in India by focusing on the major investment projects under implementation in the largest metropolitan cities and the regions surrounding them. The size and sectoral break-up of these investments, their source - central government, state government, private Indian companies or foreign companies – and the location of the projects are good indicators of the extent of economic globalisation. They reveal the types of activities gaining ascendance in India's metropolitan economies since liberalisation began, the regions of the country getting a disproportionate share of the new activities, and the extent of local and national control over local economic development.

Existing theory on globalisation as put forward by Sassen (1994) suggests a renewed role for some of the world's major cities as sites for finance and associated producer services. These cities have experienced continued concentration of economic ownership and control and have become global cities, servicing the globe rather than their geographical hinterlands or the nation states in which they are located. Alongside are vast territories and many important manufacturing centres and port cities that have lost functions and are in decline. These developments are leading to new geographies of centrality and marginality common now to both the developed and the developing countries. The newly emerging patterns of urban growth in India seem to confirm Sassen's theory.

Since these patterns cannot be fully understood unless placed in a regional context, in the first part of the paper regional development policy and its consequences for the regions of India are briefly discussed. Then I consider some of the demographic, economic and social changes that are starting to characterise India's largest cities. Against this background, the investment patterns of some of these cities are presented and their implications discussed.

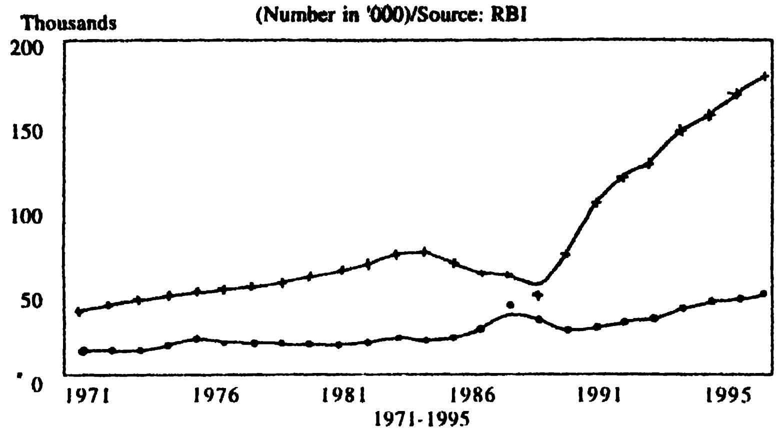
Regional Development in India in the 1990s

India's experience with regional development since independence has been in many ways similar to the experience of countries such as Brazil, Japan and South Korea [Markusen 1994]. Since second world war, in each of these countries efforts had been made to complement industrial policies with regional policies in order to better distribute national income. For this purpose, in the sixties and seventies these countries invested in smaller cities and underdeveloped regions.

The compatibility between industrial and regional policies, however, has weakened considerably in recent decades because of the shift to high technology, which strongly favours major urban areas and has therefore undermined earlier efforts at interregional equity and stability. Markusen observes: "The current commitment to high technology, emphasising innovation and human capital, is hardly compatible with decentralisation" (1994, 289). There is thus growing tension between industrial policy and regional policy, and national governments are increasingly favouring industrial policy, leaving the development of regions to local and provincial governments.

This pattern holds true for India as well. Since the Industrial Policy Resolution of 1956 until the New Economic Policy of 1991, the central government actively promoted an industrial policy that had a strong regional component. In fact, the

FIGURE 1: CHEQUE CLEARANCE AT CALCUTTA AND MUMBAI
(Number in '000)/Source: RBI



dispersal of industry through the development of a small-scale sector was one of the four major planks on which post-independence industrial policy rested [Ahluwalia 1991].

In addition, the central government played a major role in balancing regional disparities through its public enterprise location policy. By locating major steel plants, mineral extraction facilities and petroleum refineries in industrially backward regions under the early plans, it attempted to raise industrial output from these areas. While the location of public sector investment was not free from regional political pressure, which often resulted in the choice of technically sub-optimal locations [Das 1997] or relatively developed regions, such a policy did raise industrial production in states such as Madhya Pradesh, Bihar and Orissa, where there were very few industries in 1947. In fact, interregional disparities in terms of industrial employment and output fell up till the mid-seventies, particularly in the case of the large factory or the 'census sector' [Mohan et al 1992].

But this commitment to regional development became more diluted after the mid-seventies, when major public sector chemical plants were located in the western region, already quite developed industrially. Between 1972-73 and 1983-84, the contribution of Gujarat and Maharashtra, to the country's industrial output increased from 31.83 per cent to 35.68 per cent. These two states, along with the green revolution states of Punjab and Haryana and small states such as Delhi and Goa, have remained the most developed in the country.

Studies based on more recent data indicate that differences in state incomes have widened since the eighties, and India's states are diverging rather than converging in terms of growth [Ghosh et al 1998; Baru and Chowdhury 1998].[1] Much of this increase has been due to the inflow of private sector investment in small pockets of the country complemented by the location of key public sector infrastructure in these same areas.

At the same time, renewed attention has been focused on the largest cities as engines of economic growth [Shaw 1996]. As in the rest of Asia, there has been a subtle shift in urban policy in the eighties and the nineties in favour of the large city [Rondenelli 1990]. In 1991 the megacities project, funded largely by the central government, was launched to upgrade the infrastructure of Mumbai, Chennai and Calcutta [Chakraborty 1996]. Hyderabad and Bangalore were later added to the list. Delhi, as part of the National Capital Region, has had separate urban development funds. Moreover, the New Economic Policy of 1991 has made it easier to locate non-polluting industry in the large city and its environs.

However, all large cities have not been equally attractive for investment. How these cities have fared or are faring has been influenced to a great extent by their regional locations. Regional investment patterns since the opening-up process began have reinforced the existing structure of regional disparities, which favoured the already more developed capital region centred on Delhi and the western and southern parts of the country.

GROWTH OF INDIA'S MAJOR CITIES SINCE INDEPENDENCE

In 1901, India had only one city with a population of over a million: Calcutta, the administrative capital of the British Raj until 1911. By 1921, Mumbai's population had exceeded a million and for the next 25 years and more these two port cities with strong industrial bases remained the only million-plus cities in the country. Delhi, which became the administrative capital after 1911, joined this league with the huge influx of refugees in the wake of partition. Its population in 1951 exceeded a million and Delhi has since then been one of India's most rapidly growing cities. The importance of this ancient city, that had served as a capital for many earlier empires has continued to revolve around its administrative functions. Delhi is distinctly different from the old ports, which also served as major manufacturing centres during colonial times.

Chennai (Madras), an old city with a port, and Hyderabad, had also come to have million-plus populations by 1951.

Since 1951, with the gradual integration of the national economy, the locus of rapid urban growth has begun to shift to other parts of the country, and according to the 1991 Census the country now has 23 cities with a population of over a million. These 23 cities account for over one-third of the country's urban population and one-twelfth of its total population (see Map). Though these large cities are scattered among all the major regions of the country, they are more concentrated in the western and southern states. As the focus of economic growth has slowly shifted towards these regions, their urban populations have risen and so has the number of million-plus cities. Table 1 gives the details of metropolitan city growth in the different regions of India.

Table 1 clearly indicates the slow growth of the two metropolitan cities of the eastern region – Calcutta and Patna – *vis-a-vis* their counterparts in other regions. It also indicates that the north-eastern region has no very large city. By and large, the growth patterns of the 23 metropolitan cities, when averaged for the region, reflect quite closely the state of the regional economies in which they are located. When examined individually, they indicate that

(C and D Amount in Calcutta and Mumbai)

city economies tied to older industries such as cotton textiles, jute manufacturing and metal-based industries are unable to remain dynamic unless they have become export-oriented or have diversified into newer sectors.

Taking 1951 as the base (100) and examining growth up to 1991 indicates slower growth over much of the east and parts of the northern region, with cities such as Calcutta, Patna, Kanpur and Varanasi having slowed down. In fact, Calcutta with a growth rate of 1.8 per cent per annum between 1981 and 1991 has witnessed the slowest growth of all the 23 metropolitan cities. Mumbai overtook it as India's largest city in 1991. While large cities in the western region have generally grown fast, even here a textile-based city such as Ahmedabad has grown relatively slowly at 2.8 per cent per annum. Growth has been much faster in such towns based on the manufacture of petroleum products and chemicals as Vadodara and Surat, which grew at 4.2 per cent and 6.4 per cent per annum, respectively during 1981-91 [Bose 1993].

In the south, Chennai and the textile-based cities of Coimbatore and Madurai grew relatively slowly during that decade at 2.5 per cent, 2.3 per cent and 2.0 per cent per annum, respectively. In contrast Vishakapatnam, with its petroleum-based industries, and Hyderabad, with its administrative-cum-service functions and now a rising software industry, grew at 7.4 per cent and 6.7 per cent per annum, respectively.

DECENTRALISATION AND CENTRALISATION IN INDIA'S LARGEST CITIES

These two terms as used in Sassen (1994) refer to processes of change cities have been experiencing in the last two decades with the global shift from industrial to post-industrial service and information-based activities as the dominant economic sectors. While decentralisation refers to the shift in population and jobs from the central areas of the city to the suburbs, centralisation refers to the increasing concentration of certain types of activities already present in the city in well-defined locales or 'districts'.

Post-independence development in India has not only led to a proliferation of large cities but together with the global economic shift, it has also affected the economic structure of the largest cities. Aggregate data on urban areas as a whole indicate a gradual decline in the percentage of male workers (usual status) engaged in manufacturing from 27 per cent in 1983 to 23.6 per cent in 1993-94. For female workers (usual status), the decline was from 26 per cent in 1983 to 23.6 per cent in 1993-94 [Deshpande and Deshpande 1998]. Over the same period, the percentage of male workers (usual status) engaged in the services sector has increased from 24.8 per cent to 26.4 per cent, the increase for women workers (usual status) being from 31.4 per cent to 38.8 per cent. Here 'services' has been defined to include finance, insurance and business services and all other services, including community and social services.

What the aggregate data indicate quite clearly are that increase in banking and finance activity and the growth of the service sector in general has come side by side with a decline in manufacturing jobs. For some of the largest cities this process started much earlier: in the case of Calcutta, the decline in the jute manufacturing industry and industrial decline in general dates back to the sixties. However, the process has become much more pervasive since the early eighties, as the data on specific cities indicate. Between 1981 and 1991, the numbers of factory workers in Mumbai declined from 6,04,000 to 4,47,000 [d'Monte 1996], and Ahmedabad lost 50,000 mill jobs between 1983-84 and 1995 [Roy Chowdhury 1996]. In the West Bengal industrial belt, largely made up of the Calcutta Metropolitan Area, 46,000 have lost jobs as 14 jute mills remain closed since the early nineties (*The Telegraph*, July 13, 1996).

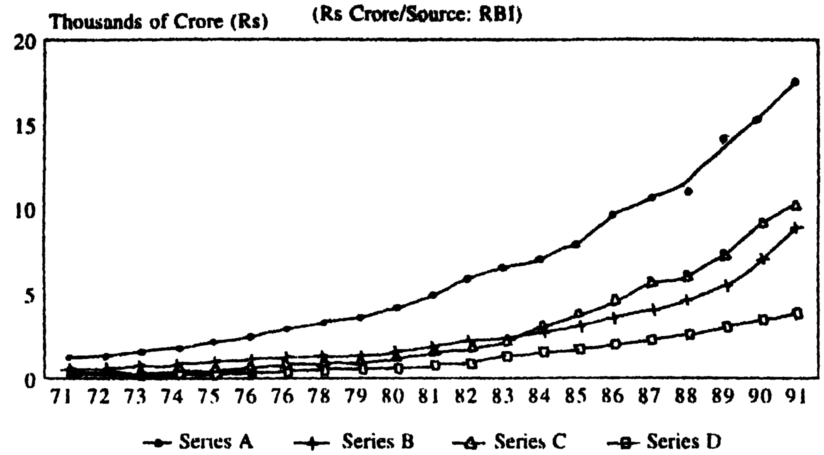
(Rs Crore/Source: RBI)



(A: Mumbai, B: Calcutta, C: Delhi, D: Chennai)

The decline of blue-collar industry in the core of the city has been accompanied by a decline in population as well, but losses in jobs and population by the core have been largely offset by an increase in both in the metropolitan fringes. Mumbai is perhaps the best example of this process of decentralisation. In 1961, the core of the city (Bombay Island) had a population of 2.7 million, or 65.8 per cent of Greater Bombay's total population of 4.1 million. In 1991, Bombay Island's population of 3.3 million was only 33 per cent of the Greater Bombay total of 9.9 million. Similarly, the population of the area within jurisdiction of the Calcutta Municipal Corporation (CMC), has been growing very slowly in relation to that of the Calcutta Urban Agglomeration, which is made up of a string of towns extending from the city and located on both sides of the Hoogly River. In 1921 Calcutta city with 1.05 million people, accounted for 47 per cent of the urban agglomeration's population of 2.25 million. In 1991, with 4.4 million people the CMC area accounted for 39.9 per cent of the population of 11.02 million of the urban agglomeration (Census 1991).

In part the decentralisation of population has been the outcome of planning: the development of industry in the core has been discouraged through restrictive legislation dating back to the seventies. At the same time, new sites within the greater metropolitan area have been selectively developed by the government to accommodate the shifting of population and economic activities and to reduce congestion in the built-up area. Navi Mumbai in the Mumbai metropolitan region and Bidhan Nagar (Salt Lake) in the Calcutta metropolitan region are examples [Shaw 1995]. The shifting of the wholesale vegetable market from Sabzi Mandi in the heart of Bombay Island to New Bombay, followed by the shifting of other commodity markets such as those for onions, fruits and steel has relieved congestion and created new spaces within the core of the old city.

Since the nineties, several cities have used the courts to remove polluting industries from the core to other locations, mainly the fringes. Witness, for instance, the Delhi High Court's order on hazardous small-scale industries within the capital and Calcutta's attempts to move its leather industry out of the corporation area. To some extent, however, decentralisation has been market-driven – high land costs pushing many firms outwards. India's largest metropolitan areas are thus becoming increasingly polynuclear, with land values rising at each emerging centre within metropolitan region.

As far the process of centralisation, the aggregate data do indicate a growth in all kinds of services within urban areas between 1983 and 1993-94. But this growth is occurring in the core of the metropolitan area or its fringes can be discerned only from city-level data.

On the basis of information gleamed from secondary sources, I briefly discuss some of the emerging trends in centralisation, taking Mumbai as an example. This city has been one of India's most studied places and continues to attract attention as India's only emerging global city [Harris 1978; Kosambi 1988; Dossal 199?; Patel and Thorner 1995]. In comparison with the pace at which the restructuring of jobs occurred in global capitals such as New York and London, Mumbai's pace has been slow nevertheless, changes are occurring in the Indian city's economic structure and its social geography with the shifting of its textile industry outwards and the centralisation of other activities.

Two trends mark the centralisation process here: the increasing importance of finance in Mumbai's economy and the growing specialisation in certain types of manufacturing and services activities. Already by the late sixties, Mumbai had emerged as India's financial capital, having located within it the country's largest stock exchange and the headquarters of the Reserve Bank of India, the Life Insurance Corporation of India, the Industrial and Commercial Investment Corporation of India, the Industrial Development Bank of India, the Unit Trust of India, and the Industrial Reconstruction Bank of India.

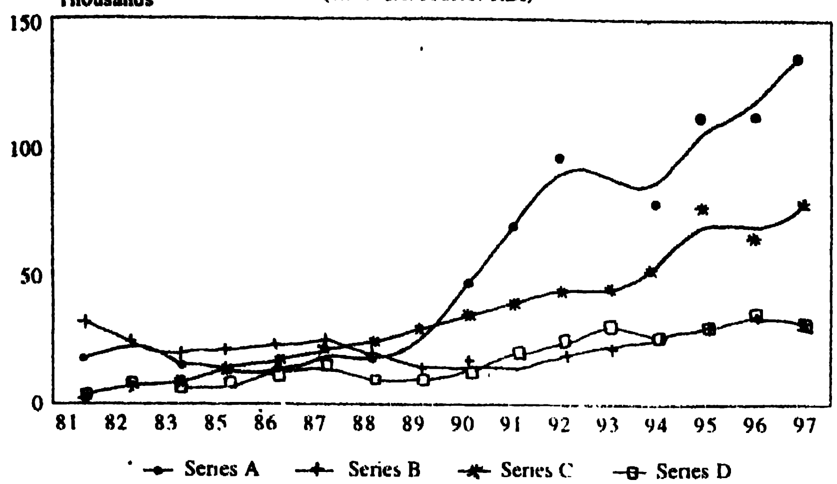
This core of activities has attracted numerous other banks, both national and foreign. Almost all major banks have their headquarters in Mumbai so much so that 70 per cent of India's bank deposits had come to be held by banks with headquarters in that city by 1972 [Harris 1978:17]. The volume of banking transactions here is thus many times larger than that in any other Indian city, and Mumbai's supremacy has increased further in recent decades.

In 1965-66 Mumbai accounted for 35 per cent of the value of total cheque clearances in India and for about 32 per cent of the total number of such clearances [RBI 1975-76:64]. After 1991, Mumbai's share of the value of total cheque clearances has risen to over 50 per cent [RBI 1995-96:106]. Comparing cheque clearances in Calcutta and Mumbai, we find that in 1970-71, the number of cheques cleared in Calcutta was only 35 per cent of Mumbai's number and the total amount was only 67 per cent of Mumbai's. By 1993-94, the number of cheques cleared in Calcutta had dropped to 28 per cent of Mumbai's, and the amount had fallen sharply to just 7 per cent of Mumbai's [Government of West Bengal 1995-96:156].

As indicated in Figures 1 and 2, there has been a rapid increase in the number of cheques cleared and the quantity of money involved in Mumbai's banks *vis-a-vis* Calcutta's after 1990-91, mainly due to the entry of foreign financial institutions. This is also brought out in Figures 3 and 4, which show comparative data on the value of cheque clearances and the value of telegraphic transfers of money issued by banks in the four largest Indian cities.

What becomes clear from the above figures is that the process of financial deregulation, which is still under way in India, has strengthened the centralisation of financial activities in Mumbai. The control function of Mumbai has also been strengthened since the nineties with the

FIGURE 4: TELEGRAPHIC TRANSFERS (ISSUED)
(Rs Crore/Source: RBI)



(A: Mumbai, B: Calcutta, C: Delhi, D: Chennai)

Securities and Exchange Board of India (SEBI), the autonomous body created to regulate the capital market, being located in that city. During the nineties, moreover, a second stock exchange (the National Stock Exchange) has come to be located in Mumbai.

Attempts were made during the seventies and eighties to disperse some of the public sector financial institutions to other parts of the metropolitan region such as Navi Mumbai. However, agglomeration economies continued to be very strong for this sector, and financial institutions, headquarter functions remain largely concentrated in the southern tip of Mumbai Island. Recently, certain departments of banking and finance institutions that need more space have started to move to central Mumbai and suburbs such as Bandra and Santa Cruz. Thus, the early nineties saw the shifting of three departments of Standard Chartered Bank from its head office in south Mumbai to Lower Parel, which is just eight km away from the downtown area and 70 per cent cheaper than the suburbs [Baria 1998].

The seventies and the eighties witnessed gradual decline in Mumbai's cotton textile industries and the loss of over 1,00,000 jobs after the strike of 1982-83 [Bhattacherjee 1988]. The period also saw a growth in petrochemical industries and in such items as rubber, plastics, oil and oil products [Harris 1996:50]. In the nineties a more spectacular transformation is occurring in 'Girangaon' in central Mumbai.

For the last hundred years this area of about 280 hectares was occupied by the cotton mills, their yards and worker tenements or 'chawls' [d'Monte 1998]. As the land occupied by closed mills is slowly entering the market, some of the old mills are being renovated for use by banks, publishing houses, advertising agencies and telecom services [Baria 1998]. The former Shree Ram Mills houses the Sakshi Art Gallery and Magnasound, a producer of video music, has an office in the Lakshmi Mills compound. High rise apartments with names such as Phoenix Towers and Falcons Castle are now a part of the skyline along with the chimneys of the old mills. Trendy restaurants are being opened for the new class of people entering an area that for decades had been the home of millhands.

This slow gentrification process has long been resisted by the workers, but to no avail. The government initially had plans to redevelop an area of approximately 5,67,718 sq metres, owned by the mills of the public-sector National Textile Corporation (NTC), in a way that would preserve the historic character of the locality, provide for open spaces and minimise the hardships of transition for the workers living there. According to observers these plans have so far proved to be insincere [d'Monte 1998]. The mill lands keep entering the market on a piece-meal basis. Their subsequent uses are market-driven.

CHANGING SOCIAL GEOGRAPHY OF THE FORMAL CITY

The demographic and economic changes discussed above have affected primarily the 'formal city' or the built-up portions of the city utilised predominantly for formal-sector activities. Such areas would include the downtown area, the main commercial and shopping areas, upper and middle class residential neighbourhoods, premises for public-sector activities and housing, and all the amenities and public goods provided by the state in such areas. As the economic reform agenda is becoming more firmly rooted and globalisation is accepted as an unavoidable reality, there is less official toleration of the informal sector in the formal city.

In a typical Indian metropolis the informal sector is all-pervasive, operating side by side with the high-rise apartments of the rich, and in the downtown area besisde prominent public buildings [Shaw 1985]. Since the early nineties, competition among India's regions and cities to attract investment, national and international, has been leading to actions that aim at differentiating between the two sectors and creating modernised and sanitised enclaves within the existing city. These enclaves, replete with five-star hotels and fine restaurants and shopping, would be suitable for Indian corporate managers and their multinational counterparts.

In addition, the downtown would need to be made clean and efficient. To facilitate faster movement of traffic, there have

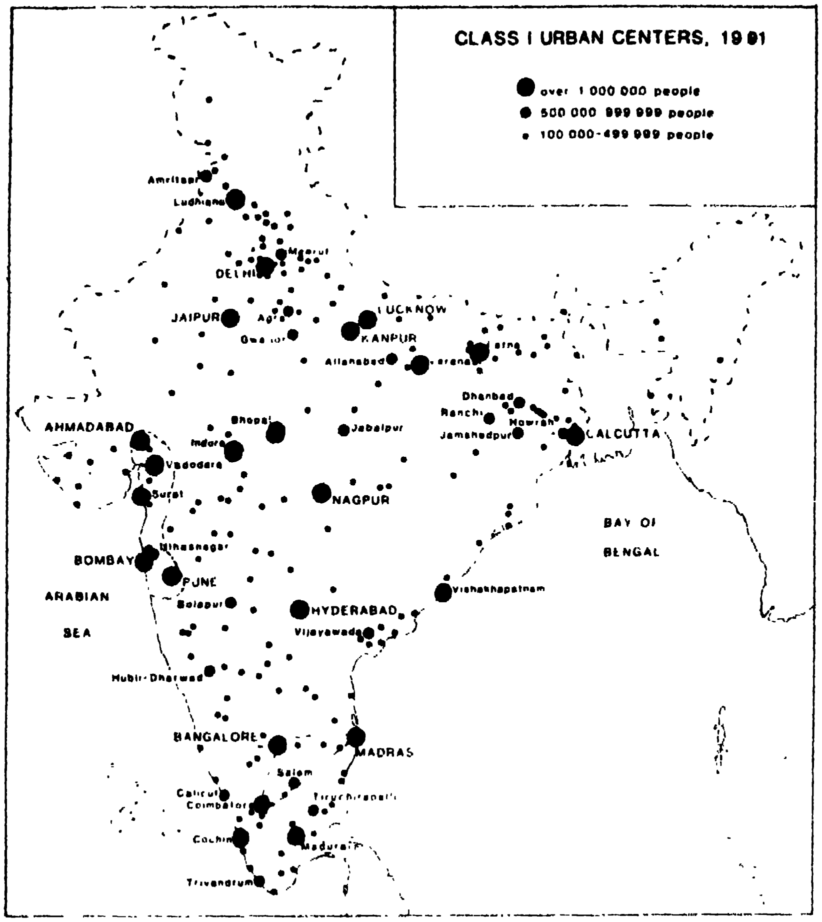
Map



been repeated drives to rid the streets of hawkers, roadside sellers and other occupiers of public space in cities such as Calcutta and Mumbai. Hyderabad too has recently begun to clean up to make a good impression on potential investors. In Calcutta, in spite of massive efforts by the civic authorities since December 1996, hawkers continue to remain active. The government finally struck a compromise by allowing them on all streets except 21 major arteries, the aim being to keep them out of the core of the formal city. These cleaning drives have been welcomed by the upper and middle classes, who have seen them as beneficial and as a regaining of lost space [Shaw 1997].

They are reminiscent of the attempts that several city governments in south-east Asia made in the seventies to make their cities modern and appealing to multinationals [Drakkakis-Smith 1989].

There is another type of action. It is typified by the closure of 168 'hazardous' factories in Delhi following a Supreme Court order passed in July 1996 (*Economic and Political Weekly* 1997). About 50,000 workers have lost their jobs and have not been properly compensated. This is only the first phase of closure. Ultimately, 39,000 units employing 7,00,000 people will be affected. Given the high price of real estate in the Delhi metropolitan area, such closures, mostly of small industries, have meant a windfall gain for the owners. The owners have not been compelled to reopen their factories at alternate locations. Selling the factory land has enriched them, and yet most of them have not paid their workers back wages for six years as stipulated in the court order.

Along with the gentrification that is occurring in Mumbai's heartland, such actions will ultimately lead to environmentally cleaner and more homogenised spaces for formal sector use in the most expensive land of the city. The informal sector will be pushed out to less valuable and visible spaces. The formal city is likely to become more and more globalised with increasing presence of global consumer culture in retail shops, banks, services and recreational activities. In contrast, the poorer parts of the city, with their older housing stock, the declining industrial areas with their unemployed, the slums and the squatter settlements constitute a kind of 'other city' linked strongly to a local informal sector.

In economically dynamic cities of south and south-east Asia, the informal sector is connected to the global economy through subcontracting work from global firms under sweatshop conditions [Seabrook 1996]. As spatial entities, both the formal city and the other city occupy disconnected fragments of metropolitan space, and their politics is locality-specific rather than class-based. These trends are already observable in Asian cities as diverse as Manila and Bangkok where "instead of mere differentiation between world regions, centre and periphery today indicate a differentiation between global society and segmented localities, both spatially anchored in world cities [Berner and Kroff 1995:212]".

Emergence of New Cores and Peripheries in Urban India

The focus of this paper is on the changes taking place gradually in the urban system against the background of these changes in the demographic, economic and social geography of India's largest cities and the emergence of new cores and peripheries. The old hierarchy of four megacities located in different regions of the country is giving way to urban corridors and clusters of new investment located mostly in the southern and western parts of the country.

With the exception of the Delhi region and adjacent areas in Haryana, Punjab, Rajasthan and Uttar Pradesh much of the north, the east and the centre of the country have been bypassed. This vast area covering the eastern half of UP and stretching across Bihar, West Bengal, Orissa, Madhya Pradesh and the eastern part of Maharashtra is emerging as the new urban periphery, still locked in old industrial bases, high unemployment and a deteriorating resource base.

As one indicator of this ongoing process of economic differentiation is the quantity and type of new investment coming into the different urban regions of the country, I now turn to the pattern of large-scale investment in some of India's biggest cities. Since the early nineties, the Centre for Monitoring Indian Economy (CMIE), an autonomous statistical organisation based in Mumbai, has been publishing data on various aspects of investment in India. The data are disaggregated by state and district and since some of the largest cities are coextensive with entire districts, it is possible to discern investment coming into these cities.

The CMIE records only investment in

project that cost at least Rs 3 crore (approximately US $ 7,07,000). This means that the economic activities of registered small-scale industries, which have an upper investment limit of Rs 3 crore and that of the informal economy, the largest employer in all cities, are excluded from the data.

As these activities contribute an estimated 40 per cent of India's industrial production, their exclusion from this record-keeping of investment needs to be explained. One reason is the much greater difficulty of getting accurate accounts from small and micro enterprises. A second reason, is the fact that these activities are more labour-intensive than capital-intensive and contribute a relatively small proportion of total capital investment. The large projects, on the other hand, could have multiplier effects in terms of jobs and income created in the city economy and its surroundings, and these could spell greater demand for informal-sector services and products.

Urban Core Areas

The following discussion, based on an analysis of the CMIE data, first highlights developments in the emerging urban core areas and then examines the new peripheries.[2] Table 2 lists the core cities by population and investment in projects being implemented.

It is clear from Table 2 that Mumbai, Chennai and Delhi have continued to attract considerable investment: in fact, Mumbai and Chennai, with adjoining areas, emerge as by far the most popular urban destination for new investment. Secondly, in all the largest cities the new investment has been directed at areas adjoining the city rather than in the city itself. Thus Delhi has attracted very few large projects but Ghaziabad, Faridabad and Gurgaon districts are experiencing considerable investment activity. Thirdly, several smaller metropolises are witnessing dynamic growth and have contributed to the extension of the old cores or are leading to the formation of new hubs of growth.

Ahmedabad-Pune Corridor

A stretch of western India which includes the Mumbai-Pune corridor and its extension northwards to include Surat, Vadodara and Ahmedabad is the country's leading core area. Districts falling within this north-west and south-east belt include Raigad in Maharashtra and Bharuch in Gujarat, each of which has seen investment exceeding that of entire states. The belt is highly industrialised along the Ahmedabad-Mumbai and Mumbai-Pune national highways and has a high percentage of urban population.

Investments within Greater Mumbai reflect the city's preoccupation with improving telecommunication services, hotels and transport. These sectors account for 26.7 per cent, 27 per cent and 8.2 per cent respectively of the total investment in projects under implementation. While the hotels are all private, transport and telephones are public-sector-controlled, with all investments being made by the government. Of note is the state government's investment in fly-overs for the city. A central government investment of Rs 142 crore in an airport terminal will enhance Mumbai's air transport facilities. Two other major infrastructure projects are a joint-sector gas pipeline project and a private hospital complex.

Investment in manufacturing has been less than that in infrastructure and services and is mainly accounted for by a major project owned by the public-sector Bharat Petroleum Corporation to produce high-speed diesel oil. This project, estimated to cost Rs 622 crore, accounts for 15 per cent of the total investment under implementation in Greater Mumbai. In contrast textiles, Mumbai's traditional industrial specialisation, has attracted only Rs 102 crore or 2.5 per cent of the total investment.

Adjoining Thane district, which the 1991 Census has considered to be a part of the Mumbai urban agglomeration, has a greater number of projects in manufacturing industry, for instance in fabrics, paper, chemicals, metal-based products and computer software. Here too investment in transportation has been large. It involves the creation of critical rail and road links with Greater Mumbai – for instance the Thane-Turbe-Nerul-Vashi railway project, which will also improve transport within Navi Mumbai.

South of Thane district is Raigad, the northern parts of which district clearly fall within the urban influence of Greater Mumbai. With transportation improving in Thane district, Raigad has become more accessible from Mumbai and during the nineties has attracted the highest quantity of investment of any district in Maharashtra. With Rs 10,925 crore to be invested in projects under implementation, it accounts for 16 per cent of the total investment in the state and 2 per cent of India's. It is Mumbai's industrial backyard, with 57 per cent of its investment accounted for by finished steel and steel products such as hot-rolled coils, bars and rods, castings and railway and ship containers. Investment by Indian corporations such as Mittals in steel and thermal electricity has been complemented by central government investment in chemicals and petrochemicals, which account for 10 per cent of total investments. The port at Nhava Sheva has attracted private-sector investment, including some foreign investment in port development, and central government investment in storage and warehousing services.

East of Raigad and adjoining it is Pune district – with Pune city at its centre – at the junction of the important routes connecting Mumbai to Solapur and Nashik to Kolapur. In western Maharashtra, Pune is thus the vital link between the cities/towns of the north and those of south and was historically very important as a Maratha stronghold. After independence and up till the early eighties, Pune remained a quiet university town with several research institutes. It was ideal for retirees because of its mild climate. But over the last 15 years it has been transformed into a bustling city with frenetic industrial activity.

Since the opening up of the Indian economy in 1991, Pune has attracted considerable investment in passenger car manufacture, three-wheeler and two-wheeler production and automobile ancillaries. In fact about 60 per cent of its total investment under implementation is in such products, with foreign companies such as Mercedes-Benz and Indian companies such as the Tatas and Bajaj making contributions.

Steel and steel products account for another 8 per cent of total investment, while tractors, diesel engines and other heavy equipment account for another 10 per cent. Foreign domestic appliance manufactures such as Daewoo and Matsushita are gradually entering Pune, and their investments account for about 3 per cent of the total. A 100 per cent export-oriented floriculture project and the cultivation of upmarket horticultural products such as mushrooms are also making their presence felt in Pune district

The Southern Hubs of Growth

Chennai and Coimbatore, together with Bangalore represent the new growth that south India is experiencing. Chennai city itself has not attracted much investment other than a private-sector power project which accounts for 40 per cent of the total investment of Rs 2,075 crore that is under implementation in the city, a railway project worth another 29 per cent and some private hotels worth 15 per cent. Foreign consumer electronics and textiles represent 5 per cent and 3 per cent of the total respectively.

It is the greater Chennai region – the district of Chengalpattu MGR or Chengai-Ana surrounding Chennai – that has become an industrial hub for the entire south. Of the Rs 13,505 crore of investment under implementation there, 22 per cent is in chemicals (private-sector) 18.6 per cent in petroleum products (central government) and 41 per cent in passenger cars and car ancillaries. Hyundai, Mahindra Ford and Hindustan Motors are building new units for passenger car production. Foreign capital has also entered the field of car ancillaries manufacture. While the bulk of the investment in this district has been private, the government has invested about 9 per cent of the total in infrastructure, including a port at Ennore, the Cheyyar rail bridge and a technology and industrial park at Gummidipoondi.

Bangalore is the second point of the southern urban triangle. At the time of independence, its industrial base was dominated by textile production, home-made and factory-made, and public sector units such as Hindustan Aeronautics. Rapid growth since independence has greatly diversified this base. The fifties and sixties saw the establishment of key public-sector research institutes and production facilities in Bangalore, the late sixties and seventies, the growth of a state government bureaucracy and government-run businesses; the eighties the growth of private enterprise, particularly in micro-electronics, and the late eighties the entry of multinational corporations and the city's emergence as the 'Silicon Valley' of India [Heittzman 1997].

Each of these phases of growth has left its impact on the industrial structure of the metropolitan region. Although textiles, silk weaving and the numerous public-sector enterprises are still the largest employers, they are not the areas of dynamic growth. Private-sector enterprises, in micro-electronics hardware and software production with foreign tie-ups represent the growth sector in the city.

Under construction at Whitefield is a joint-sector technology park estimated to cost Rs 1,650 crore, 55 per cent of the total investment under implementation in the city. Cigarette manufacture, computer software, hotels and aircraft manufacture account respectively for about 13.6 per cent, 7 per cent, 8 per cent and 3.6 per cent of the total investment under implementation. Snacks, footwear and silk yarns and textile articles comprise much of the balance. Rural Bangalore, on the other hand, is the site of a Volvo unit for the manufacture of buses and a Toyota-Kirloskar plant for utility vehicles.

The third point of the southern urban triangle is Coimbatore district, 53 per cent of whose population lives in urban areas. The million-plus city of Coimbatore and Tirupur, a town of 3,06,000, dominate this district. Both are textile-based towns but there the similarity ends. Coimbatore specialises in cotton yarn production and has numerous large mills, while Tirupur is well known for its knitwear, specifically cotton T-shirts produced by numerous small-scale industries for export [Gulati 1997]. Coimbatore, though a much larger city, has grown less fast over the last two decades than Tirupur, whose growth rate of 41.55 per cent during 1981-91 has been the highest among the 25 Class I towns (towns with a population exceeding 1,00,000) in Tamil Nadu.

Apart from some new investment in cotton yarn, Coimbatore has not attracted much investment in the nineties. Tirupur, on the other hand, has done well for a town of its size. The dynamic growth of its export-earning cluster of small-scale industries has increased its importance. Currently under implementation are a number of public-sector projects to improve road and telecommunication facilities in that town.

The Rising Star: Hyderabad

No other city has been hailed as much by the media as Hyderabad as symbolising an information-based economy exporting to global markets and drawing on high-quality professionals and technology as Hyderabad. And no other state has received as much media attention in this context as Andhra Pradesh. Though Bangalore is still ahead in terms of its software output, Hyderabad is predicted to overtake it in the 21 century. The thrust towards software and information systems of Andhra Pradesh and Hyderabad received a big boost in the mid-nineties with Chandrababu Naidu coming to power in the state.

An important addition to the Hyderabad scene since the Naidu government took over was the establishment of the Indian Institute of Information Management (IIIM), with major software corporations such as IBM, Oracle and Microsoft participating in the development of its educational resources. Another one was the opening in December 1998, of the much-publicised Hi-Tech (Hyderabad Information Technology Engineering Consultancy) City a joint-sector project which cost Rs 1,500 crore. This is a unique techno park with a wide variety of infrastructure facilities for information technology. Spread over 158 acres, it is the largest of its kind in Asia [Menon 1998]. Thanks to reliable power supply, high-speed global connectivity and other support systems, two-thirds of its space has already been sold.

Madhapur, the suburban area housing this part, has attracted other IT companies, for instance Baan Infosystems and Info Tech Enterprises. This investment together with that in Hi-Tech City accounts for 72 per cent of the total investment under implementation in Hyderabad. Of the balance, around 8 per cent comprises the government's investment in infrastructure such as roadways, telephone communication services and airport expansion.

Hyderabad's software exports accounted for only Rs 4 crore in 1992. By 1997-98, this had increased to Rs 273.3 crore. Hyderabad has recorded a growth of 140 per cent in its information technology sector over the past few years. Its earnings from software exports and other domestic IT services are likely to reach Rs 2,000 crore by 2000 and Rs 16,000 crore by 2005 [Menon 1998]. Hyderabad's one disadvantage *vis-a-vis* Bangalore is that there is no large city or corridor of smaller cities close to it. Synergies from the spillover of inter-urban interaction are limited here, and this could affect its growth.

Delhi Region

Delhi has exercised a magnetic pull on new investment, but most of it has gravitated to smaller towns adjoining the capital rather than to the capital itself. Cheaper land and easy access to the capital have been among the reasons for this. Other than two large private hotels, most of the investment in the capital itself has been made by the central government – in telephone communication services and a small railway bridge project. The much-publicised metro rail project, which will involve an investment of Rs 4,860 crore is still under negotiation.

In adjoining Gurgaon district there has been investment of Rs 1,500 crore by the central government in the expansion of the Maruti Udyog car plant. There has been some private investment in auto ancillaries, storage batteries and compressors and hotels. In Faridabad the central government is implementing a Rs 1,163 crore gas-based thermal power plant, while private capital has been invested in a wholly export-oriented floriculture project, ice-cream, cloth and lube oils over the last few years.

Ghaziabad (UP) has drawn the most investment of the districts adjoining Delhi,

with considerable foreign capital in consumer electronics and the Daewoo Motors plant under construction. In fact, about 77 per cent of the total of Rs 5,549 crore invested in projects under implementation in Ghaziabad is foreign capital, with the Daewoo Motors plant accounting for 62 per cent of the total. Auto ancillaries, oil-based thermal electricity, cement, frozen food and a five-star hotel and golf resort, are other areas of private investment.

Growth in the Core Analysed

The core areas show some common features regarding investment patterns. First, the complementary role of the public sector *vis-a-vis* the private sector. Investment by the government has targeted areas favoured by the private sector either through outlays on critical infrastructure or through investment in key industries such as chemicals and petrochemicals. Secondly, in each of the largest cities in the core, that is, Mumbai-Pune, Delhi, Chennai and Bangalore huge investments have been made in the manufacture of automobiles and automobile ancillaries. Much of this investment has been made by foreign car companies. Foreign capital has also been entering the area of domestic appliances.

Thirdly, although the economic base of the largest cities continues to be diversified, the dynamic sectors are only a few and show a considerable degree of specialisation. This means that their human capital requirements will be highly specific and their employment effects limited. Fourthly, many of the fast-growing sectors produce consumer products and services that reflect the spread and acceptance of a global material culture by India's middle and upper income groups. The largest metropolitan cities are the best markets for this culture.

The Periphery

This is a broad term that encompasses all those regions not experiencing growth of the type described above. It is a vast area spread over the north-east, the east (Bihar, West Bengal, Orissa), central India (Madhya Pradesh and the eastern parts of Maharashtra and Uttar Pradesh) and the northern borders (Jammu and Kashmir and the interior of Rajasthan). The socio-economic differences between the economically dynamic regions and these slow-growing and economically stagnant regions are getting accentuated as liberalisation advances [Dutta and Goswami 1997]. The metropolitan regions falling in the periphery are given in Table 3.

As can be seen from the table, only eight of the 23 metropolitan cities fall in the periphery. As a whole, the periphery comprises less urbanised and less industrialised states or portions of states. Secondly, it contains regions and cities that once saw better times – Calcutta best epitomises this decline. Calcutta today ranks fourth – after Mumbai, Delhi and Chennai – in many important economic functions. Though Calcutta's decline began with its loss of capital-city status in 1911, it was hastened further by the overall decline in manufacturing industry that has beset West Bengal since the early sixties and which persists.

In the sixties West Bengal, along with Maharashtra, was India's leading industrial state, accounting for 14 per cent of India's industrial output. This had fallen to 9.8 per cent by 1980-81 and 5.6 per cent by 1992-93 [Government of West Bengal 1996:110]. Industrial decline has affected all spheres of business and commerce and is reflected in the slowly declining share of Calcutta's port and airport in all-India foreign trade. In 1985-86, 10.57 per cent of India's exports and 9.57 per cent of India's imports passed through Calcutta's port and airport. By 1995 this had fallen to 2.69 per cent and 5.5 per cent respectively [Government of West Bengal 1996:150].

Compared to the other metropolitan cities in the periphery, however, the Calcutta region has attracted some investment since 1991, though the scale of investment, particularly that undertaken by the private sector, has been relatively small. The largest project under implementation in Calcutta city is a Rs 600 crore project for waste recycling funded by the state government. Cellular mobile phone service and hotels have also seen some investment and a private sector leather complex is coming up.

What is interesting to note about investment in the Calcutta metropolitan region is that about 31 per cent of it is in the expansion of existing units. Thus, while there has been no new investment in the manufacture of cars in this region, Birla's old factory is being expanded at a cost of Rs 100 crore. Similarly the investment in paper, tyre tubes and tubes has been for the expansion of existing factories. The one major new investment project in the metropolitan region is a private coal-based electricity plant coming up at Budge-Budge at a cost of Rs 1,853 crore.

Nagpur is another city in the periphery. While it has some private investment in its steel products, it cannot match the dynamism of the cities of the western part of Maharashtra. In fact this city has seen the closure of many small-scale industries due to lack of effective demand for the capital goods produced by its large firms. In the other metropolitan cities of the periphery, the amount of investment under implementation is quite small, and in the case of Patna, Varanasi, Indore and Bhopal it is entirely accounted for by the central government's outlay on small infrastructure projects. These cities have not attracted any private investment. Kanpur, on the other hand, has attracted private investment – though only a small amount – in the manufacture of two-wheelers.

Conclusion

The focus of this paper has been to highlight first the unevenness in the distribution of the new investment made in the country since the early nineties and second, its impact on the major cities. A detailed examination of the size and type of investment in the larger cities indicates that there are emerging urban cores of high investment where growth is based predominantly on automobile production, consumer electronics, computer software and information technology, chemicals, petrochemicals and steel production.

These cores are geographically confined to the Ahmedabad-Pune urban corridor, the southern urban triangle of Bangalore-Chennai-Coimbatore, the northern region centred on the Delhi capital region and nearby areas in Rajasthan and Punjab, and new hubs of growth in the south such as Hyderabad, Vishakapatnam and Kochi. The remaining metropolises and the regions surrounding them have been virtually bypassed by the new growth that has followed the liberalisation of the Indian economy. Quite clearly, the disparity between the northern and southern halves of the country that was beginning to emerge has become more entrenched during the nineties.

Notes

[Based on a paper presented at the International Conference on 'City, State and Region: Toward the 21st Century' held in Hiroshima University, Hiroshima, Japan from December 19-20, 1998.]

1 This is seen in the case of both the per capita incomes of the states and the growth rates of per capita income. For instance, in 1970-71, Punjab, the wealthiest state, had a per capita Net State Domestic Product (NSDP) that was 39 per cent above the Indian average. By 1995-96, its per capita NSDP had risen to 50 per cent above the Indian average. At the bottom end, in 1970-71 the state of Bihar had a per capita NSDP that was only 60 per cent of the Indian average. By 1995-96, Bihar's per capita NSDP had further declined to only 39 per cent of the country's average.

2 The CMIE data on total investments comprise investment in projects that have just been announced, projects that have been formally proposed and those that are actually under implementation. Since there is big gap between investment in projects being implemented and total investments announced, the figures used here are based on what is actually being implemented.

Patent Lies and Latent Danger

A Study of the Political Economy of Patent in India

Biplab Dasgupta

The creation, under the TRIPs agreement of 1994, of a uniform, standardised international patent regime, unheedful of the differing levels of development, natural and human endowments and history of various countries, has become controversial. Firstly, such a regime clashes with the 1993 convention on biodiversity wherein 170 countries have upheld the need for diversity. Secondly, the increasing patenting of life forms in the developing countries by the MNCs under the pretext of bio-prospecting will lead to a patent regime overwhelmingly in favour of the developed countries. Moreover the 20-year period of product patent rights together with the monopoly marketing rights eliminates the possibility of competing with the MNCs on equal footing. In such a scenario, what should India's position be on this issue?

I
Introduction

IN recent months/years public attention has been focused on the issue of patents, largely because of the devious manner in which attempts have been (and are being) made by both the BJP and the Congress governments to stifle public debate on this highly important issue having serious implications for India's future course of economic development. At the same time, the very obscure nature of the subject as also the jargon deployed - legal, technical, economic and scientific - have erected barriers to a proper understanding of the issues. This paper is an attempt to present the issues in a simplified form as a step towards a major national debate on these.

The paper deals with four types of proposed amendments to the Indian patent legislation and their implications for the Indian economy and society. First, amendments to the Indian Patent Act of 1970 that need to be carried out by 2005 AD in order to conform to the international patent regime (IPR) prescribed by the World Trade Organisation (WTO). Second, the transitional amendments required by the Trade Related Intellectual Property Rights (TRIPs) agreement pending such overhaul of the patent system, in particular the provisions regarding exclusive marketing rights (EMR) and the setting up of a mailbox for receiving patent applications, that is being debated at the time of writing this paper. Third, the proposed bill on biodiversity, being prepared by the ministry of environment to give effect to the international agreement on bio-diversity that was signed in 1992, that is nine years ago. Lastly, the bill on plant varieties, mainly to safeguard the interests of plant breeders, to be sponsored by the ministry of agriculture. While transitional rules are being discussed now and will be placed for approval to the parliament in the last week of February 1999, those on biodiversity and plant breeders' rights are also likely to come before the parliament during the comming budget session.

The paper is divided into five sections. In Section II we examine concept of intellectual property right and arguments justifying and opposing patents. In Section III this paper examines the main features of the international patent regime established by the TRIPs agreement at Marakesh in 1994, that is being implemented by WTO, the new organisation founded on January 1, 1995, to replace General Agreement on Tariff and Trade (GATT). Section IV deals more specifically with the issue of biopiracy and various ways of protecting the biological wealth, while Section V deals with the political economy of patent, in the Indian context, in particular the controversy around the amendment to the Indian Patent Act of 1970 in recent weeks and months.

II
The Concepts of Intellectual Property and Patent

Intellectual Property

Intellectual property, as the name implies, has something to do with mental work, such as a song, a music, a poem, a film, and a computer software package, unlike properties such as land, car, or machine that are tangible and have a physical existence. Intellectual property right (IPR) is a right on such properties, and is recognised by laws relating to copyright, trademark or patent. Copyrights are governed by the Berne convention for the protection of literary and artistic works, as revised in 1971 in the Paris Convention, and are recognised for 40 to 50 years. Trademark, another type of intellectual property, reflects the goodwill of a company, eg, the logo of Bata Shoe Company, and carries the imprint of quality production. Some brand names are so well known that people identify those with the products themselves, eg, Mobil, the production of Socony Mobil Oil Company, as motor oil, and Xerox, a product of the Rank Xerox company, as photocopying itself. These popular brand names or trademarks – here we are not talking about products that carry their logo, but only the right to use those names – can fetch very high prices if sold in the market.

To qualify for patent right – another type of intellectual property right relating to invention of products, such as machines or medicines – three conditions need to be fulfilled: the invention has to be novel, non-obvious and of practical use. The inventor has to produce something that did not exist earlier. It has to be something that cannot be deduced quite easily, by those who know the subject, from what is already known. Further, an idea, a theory or a mathematical formula cannot be patented; it has to be embodied in something that satisfies some practical needs. An inventor fulfilling these conditions can apply to the patent office, giving description of his invention, if necessary with diagrams or models, and providing evidence in support of his claim. The patent right is conferred after the verification of such claim, according to a well laid out procedure, by the patent office [Armitage and Davis 1994: 5-7; Quick's Guide 1996: 1].

The patent right endows its holder a time-bound monopoly in the given product. The right is more negative than positive in its orientation. For example, Article 10 of the European patent legislation does not authorise implementation, but merely entitles the patent-holder to prohibit others from exploiting it for industrial and commercial purposes [Manally 1997:4]. During this specified time period no one

else can produce the patented product without his permission. The patent-holder can exercise his right in a number of ways. If he so desires and can mobilise enough funding on his own, the patent-holder can set up a factory producing this, and, thus, can make the most of this monopoly right by earning a huge profit. As an alternative, he can sell his patent right to another company at a high price or can lease out his right to others to produce it subject to certain conditions. He can give his right to Company A, only to produce for the market in Market X and for no other market, and only for, say, three years, at a fee. In other words, like land or car, he can sell, transfer, lease, gift or otherwise dispose of his intellectual property. Such rights continue only during the patent period; at the end of which anyone can produce it without his permission.

The justification usually given for the time-bound monopoly allowed to an inventor is that it allows the inventor to recoup his cost of developing this product and also to compensate him for the risk he undertook. Further, it is also expected that such rewarding of innovation would encourage others to bring into being new things or new ways of doing old things, and, thus, help to extend the frontiers of scientific and technical knowledge that is going to benefit mankind as a whole.

On the issue, how far and to what extent patents provide incentive to invent, no clear and unambiguous answer can be given. Though several studies show a close relationship between patent and investment, several others fail to reveal any. There is no evidence that Holland and Switzerland were harmed during their years without patent, in 1869-1912 and 1850-1907, respectively. One Canadian study showed that patents were not important in investment decisions. As one scholar observed: "Overall there is no direct statistical association between the existence of patents and private R and D investment. Stronger patent laws are associated with more patent applications, but whether those inventions would be forthcoming even in the absence of IP protection is not known with certainty." Patents never lead to total exclusion of others, as the rivals can 'invent around' a patent and make patenting less attractive [Lesser 1991:33, 35-36]. All these not to deny that patent rights, by establishing individual property in their invention, do provide incentive for invention in societies dominated by individualised values and norms, but to put such claims in a proper perspective. The history of mankind is replete with inventions having deep impact on the course of development, such as the invention of stone tools and wheel, for which the inventors were not commercially rewarded.

Coming to agriculture, by far the biggest progress in increasing productivity in India has taken place under a no-patent regime – the green revolution technology. Since the mid-sixties, the green revolution technology has led to a tripling of India's food production in three decades. While sharing many of the ills associated with privatisation of rights and dependence on MNCs, it was free from the patent regime. What made green revolution possible was the purchase of a few kilogrammes of 'foundation seed' of high-yielding wheat, rice and maize varieties from CYMMIT of Mexico and IRRI of Manila, their cross-breeding in agricultural universities, particularly at Ludhiana, with local varieties to produce new varieties that combined the high-yielding properties of exotic varieties with the durability and adaptability of local varieties to local ecology, and then to release those after several years of experimentation to seed farmers. The seed farmers multiplied those new varieties and sold those to actual farmers who planted those [Dasgupta 1976].

The debate on intellectual property and the role of patents in disseminating or obstructing information has raised many interesting questions that remain unresolved. It was Arrow who highlighted the fundamental paradox of information, a global public good with an innate capacity for diffusion. Information is not marketable until revealed, as its value is not known prior to its revelation, while consumer's willingness to pay can be concealed after revelation of the information – since transfer has already occurred. Further, it is extremely difficult to segregate between information flows, as there are a multitude of potential paths leading to the same conclusion [Swanson 1997: 153-55].

III
Global Intellectual Property Regime under GATT-WTO

In India, as early as in 1852, under the British colonial regime, the first patent legislation was passed and a patent office was established. Similar patent legislation and accompanying offices and procedures came into being in other countries too. A number of important international conventions on intellectual property rights predate the TRIPs agreement at Marakesh in April 1994, such as the Stockholm Convention of 1967, the Berne convention for the property of literary and artistic works and its Paris Act of 1971, the Rome convention of 1961 for the protection of performers, producers of phonograms and broadcasting organisations and the 1989 Treaty on Intellectual Property in Respect of Integrated Circuits or IPIC accord [Schott 1994: 115-16].

Until 1995, the World Intellectual Property Organisation (WIPO), based in Geneva and established in 1974 following a world intellectual property convention at Stockholm in 1967, was the agency to look after such issues. There have been several international conventions on patent rights, between the Paris (1883) and the Stockholm (1967) ones, at Brussels (1900), Washington (1911), The Hague (1925), London (1934), and Lisbon (1958) and nearly all the issues relating to intellectual property examined by the Marakesh agreement had been covered by those [Keyala 1998:19]. WIPO made a distinction between four types of patents: product *per se*, product by process, by uses and by processes. Aspirin is patented as a product *per se*, but its anticlotting property can also be taken as a use patent; one cannot use the second patent without infringing the first. Patents were usually for 14 to 20 years, but there were wide variations among countries in terms of patent period specific to various items. Most less-developed countries and Europe excluded plants and animals or the method of treatment of human or animal body from patent law, and many also excluded foodstuff and medicine [Lesser 1991:10-15, 28]. Generally speaking, individualisation of rights in intellectual property by way of patents have accompanied capitalist development in industry and agriculture for more than one-and-a-half century, along with individualisation of other property rights.

The reason why this subject has become controversial in recent years is because of the creation, under the TRIPs agreement of 1994, of a uniform, standardised international patent regime that applies uniformly to all the countries, irrespective of their levels of development, natural and human endowments, and history. To justify GATT takeover in an area hitherto reserved for another international agency, WIPO, the 'trade related' part secrecy is usually fostered by the fear of stealing of industrial secrets by rivals and their patenting to those ahead of the former. Industrial espionage has become a fact of life in the developed countries. The overall experience is that patents create monopoly and erect barriers to dissemination of knowledge [Corner House 1997:3-5].

The TRIPs takeover of WIPO role is not first time that international bodies, mostly

affiliated to United Nations, have been supplanted to make room for the world economic trinity – holy or unholy according to one's point of view – of fund, bank and WTO. The United Nations Environment Programme (UNEP) has been supplanted by Global Environment Facility led by World Bank, trade issues have been taken over from the United Nations Conference on Trade and Development (UNCTAD) and given to WTO, investment measures have been taken away by WTO from United Nations Industrial Development Organisation (UNIDO) and labour standards from International Labour Office (ILO).

Marakesh Agreement

The recent controversy on patents arises from the Marakesh agreement of April 1994, following seven years of trade negotiations under the Uruguay round of GATT, from 1987 to 1994. During this last round of GATT negotiations a number of new items were introduced: intellectual property rights (IPR), services, and investment among others. Further, drastic trade liberalisation was proposed in cases of textiles, agriculture and government procurement, while several trade rules such as anti-dumping, subsidies, countervailing measures and safeguards came under discussion [Dasgupta 1998: Chapter 4]. Initially, the less developed countries, including India, strongly opposed the introduction of those new items in GATT negotiations, but after the disintegration of the Soviet Union in 1991, such opposition withered away.

The two years of discussion on Dunkel draft (1991-93) was an exclusively rich country matter. The dispute was mainly between western Europe and the United States on the question of agricultural subsidy, while Japan also played a major role [Dasgupta 1998: 163-64]. The final Marakesh agreement of April 1994 also included a number of separate agreements on services, investment, intellectual property and agriculture among others. In all, 38 such agreements were signed. The signatory countries were not given the option – as had always been the international practice, followed even in the case of agreement of the European common market – of opting out of some of the provisions, its signature on the one and only dotted line signified agreement with the entire document, comma, semi-colon, period, all. TRIPs, the most important amongst those, has led to the establishment of an international patent regime. The member countries have been asked to amend their own patent laws in conformity with the latter within a given timeframe [Dasgupta 1998: 170-74].

Complaints about Piracy

For several years preceding Uruguay round GATT negotiations the western countries had been complaining about the 'piracy' of their intellectual property by China and east Asian countries. In 1990, eight cases were lodged by the US government under Super 301, against less developed countries, on the violation of IPR. In 1988 IBM induced the government of the US to put Brazil on Super 301 hit list, following allegations over a national informatics law that was designed to protect the national computer industry; the threat was withdrawn only after Brazil agreed to amend that legislation. In 1987 and 1988, similar disputes with South Korea and Thailand on software protection were resolved after the 'offending' legislation were amended [Watkins 1992:81-82]. China too came under the threat of Super 301, and was asked to introduce patent legislation and to pay royalties, retrospectively, on patent infringement dating back to 1986 – though it was ignored by the Chinese [Watkins 1992:131].

Thus, a strong lobby had been operating in the US and other western countries from the early eighties that felt that their position at the cutting edge of technological progress was being eroded by unauthorised copying of their intellectual property. And while 'export-back' of the 'pirated products' to the US could be restricted by the US law, they felt that, such piracy restricted their markets in the other countries. A globalised patent regime was the only way to protect themselves from such 'piracy', they argued [Deardorff 1993:435].

Some estimates were made in the late eighties to show that the US firms were annually losing around $ 61 bn from such piracy of their intellectual property, around $ 3-6 bn of those by the chemical and pharmaceutical industry alone [Lesser 1991:1]. The lobbying became more intense as the Uruguay round GATT negotiations proceeded. The Dunkel draft was severely criticised for its failure to bring the patenting of all life forms under the GATT rules. Similarly, the Marakesh agreement was criticised for its failure to grant 'pipeline' protection for drugs already invented but not yet on the market. A section of that lobby even demanded withdrawal of the US from the Uruguay round should their demands remain unfulfilled [Watkins 1992:130]. A large component in this coalition in favour of globalisation of intellectual property rights was agro-chemical conglomerates, such as Pfizer, Monsanto and Du Pont. In case of grain, Cargill Corporation played a key role in advising US government on this issue [Watkins 1992: 38]. The signing of TRIPs signalled the victory of their sustained campaign for years.

TRIPs agreement provides a comprehensive set of global trade rules for the protection of copyrights, patents, trademarks, industrial designs, trade secrets, semiconductor layout designs, and geographical indications, that apply to all the member countries irrespective of their levels of development, natural and human endowments and history [Schott 1994: 117-18]. Every member country has been asked by WTO to amend its national patent law to conform to that universal, globalised format. Under Article 65, the developed countries have been asked to change their laws within one year, and the less developed countries within another five years, and an additional five years for legislation relating to pharmaceuticals, agro-chemicals, food, alloys, etc. The least developed countries have been asked to make those changes by 2005 AD [Schott 1994:120].

Contrast with Rio Earth Summit Call for Bio-Diversity

This attempt at global standardisation and uniformity by way of TRIPs agreement is in conflict with the main thrust of the Rio Earth Summit of 1992 that set out the conditions for sustainable development. These two reveal two contrasting types of international approaches and norms. While the 1992 Earth Summit and the 1993 convention on bio-diversity (CBD) focused on 'diversity' as being fundamental to sustain life and development, TRIPs and WTO are pushing for 'conformity' to international standardised norms on patents, services, labour, investment and what not, irrespective of their history, ecology, level of economic development, etc [WCED 1990]. But despite their diametrically opposed viewpoints, 170 countries signed CBD upholding the need for diversity, and 150 countries signed the TRIPs agreement in 1994 claiming the urgency of uniformity, with a very large element of common names (130) in both [Gaia and GRAIN 1998:1-2].

The convention on biodiversity (CBD) in its Article 16.5 specifically asserts that intellectual property rights must not be in conflict with conservation and sustainable use of bio-diversity, a provision that has been totally ignored by those who composed the TRIPs agreement [Swanson 1997:1; Gaia and GRAIN 1998:1,3]. While in case of agriculture the higher yield of patented products induce the

farmers to switch from a more varied production pattern, the resulting narrowing of genetic base makes the economy and society more vulnerable to plant diseases and epidemics [Lesser 1991:61; Gaia and GRAIN 1998]. It is true that the move towards cultivation of a smaller number of higher yielding varieties and the uniform spread of the same variety over a large space predates the present debate on patent, particularly since the introduction of the green revolution technology in the mid-sixties, but there can be no doubt that the latter has brought about a qualitative change in the scenario and has created possibility of a vast quantitative change too in that direction [Dasgupta 1976; Lesser 1991: 61-63]. So far no attempt has been made to reconcile the two conflicting approaches of CBD and TRIPs. If diversity is so important for sustaining life, how can WTO demand conformity to standardised global formats?

Other Issues

Questions have been raised as to how far this new patent régime would allow effective competition or dissemination of information. Some have taken the view that it departs from the competitive ideals and further restricts the access of the poor countries to technology [Stewert 1993: 20-21]. While the main thrust of GATT negotiations in the past had been against protection of domestic industries by way of tariff or quota restrictions, TRIPs is by its very nature a protective arrangement [Deardorff 1993: 436]. Its Article 39 provides for the protection of undisclosed information, except where necessary for public good.

The moral tone underlying TRIPs, that (a) one is entitled to enjoy the fruits of his creative activities, and (b) piracy of intellectual property is unethical, has also been challenged on the ground that this is a Euro-centric view of culture, reflecting individualist capitalist western value system. What is piracy and what is not is a matter of national patent law, governed – at any rate until the universalised patent regime under TRIPs – by the principle of territoriality.

Even in the west where intellectual property is jealously guarded against piracy, ideas cannot be copyrighted, only their expressions in a particular form can be; and even in that case the protection given is valid only for a given time-period. In other words, implicitly, even the west sees the benefits of protection declining over time as the social cost of patents exceeds its benefits. Patent rights are not absolute, and are to be judged in terms of their social utility. Needless to add, estimates regarding costs and benefits also vary over space [Deardorff 1993: 438-40].

While the US sees patents as a matter of individual right, to some it is one of national economic policy [Lesser 1991: 1-2]. Patent rights, while providing incentive to invent, grant a monopoly and give rise to monopoly prices, thus reducing consumer welfare, as he would now consume less than he would have without such monopoly [Deardorff 1993:441]. In this sense, patent is very much like import control and in having a similar social welfare impact on consumers as the latter. Thus, if import control is bad, by the same reasoning, patenting is also equally bad – one cannot uphold one and decry the other.

It has also been found that about two-thirds of patented products are never produced. They are patented to keep rivals away from the field, while the firms concerned continue to produce similar products catering to the same type of consumer need, thus further reducing consumer welfare [Lesser 1991:5]. Although most national patent laws provide for 'compulsory licensing', that is forcing the patent-holder to permit use of patented product by others, that is not easy to implement [Lesser 1991: 16, 25]. The TRIPs agreement is not keen about compulsory licensing, and provides for detailed conditions regarding notification, remuneration, and judicial review, etc, before such compulsory licensing can be introduced. Compulsory licensing of semiconductor technology is only allowed 'for public non-commercial use', or to remedy anti-competitive practices and must afford adequate compensation to the right holder, under Article 31C [Schott 1994:119]. On the other hand, in patent legislation of several countries, such as Argentina, Brazil or China, the 'compulsory licensing' provisions more effectively force the patent-holder to desist denying access to the patented product and makes it possible for others to apply to the patent authorities for permission of such use against a fee or royalty [Keyala 1998:75-77].

Another aspect of this globalised patent regime is its differential impact on the more or less developed countries. Vaitsos estimated in 1972 that, in case of the less developed countries, 80-85 per cent of the patents is held by foreign interests, a figure confirmed by a subsequent UNCTAD study in 1975 [Vaitsos 1972:77]. It is more than likely that the proportion remains the same now or has actually increased [Lesser 1991:45]. According to a more recent document of WIPO, the citizens of developed countries hold 95 per cent of African patents, 85 per cent of Latin America and 70 per cent of Asia [Gaia and GRAIN 1998: 7]. According to another source, the vast majority of bio-tech patents are in the name of the companies originating in the west – in 1990, 36 per cent of those were in the name of the US companies, 32 per cent in the name of the European community companies, and another 23 per cent in the name of their Japanese counterparts – an aggregate of 91 per cent [Swanson 1997:104].

Given that an overwhelming proportion of patents originate in the developed world, patent protection is likely to lead to a transfer of income from the less developed to the more developed countries and thereby to widen income disparities between the two [Deardorff 1993: 445]. The less developed a country is at the beginning of the globalisation process initiated by WTO the greater would be its difficulty in pushing exports and in competing with products supported by the international patent regime. Therefore, for these countries "although the export market remains an important option, it cannot be the sole route" [Fishlow and Gwin 1994: 9]. As one Fund-Bank document concluded in 1994: "Countries with less immediate scope for attracting high-technology investment or exporting intellectual property tend to regard TRIPs as a mechanism for transferring economic rents to technologically advanced countries" [Development Committee 1994: 71].

Another consequence would be a shift away from the public domain as public funding of research and development for the overall benefit of citizens would be replaced by private companies solely concerned with their own profit [Dommen 1993: 10]. Generally speaking, most basic scientific research is undertaken with public fund, mainly by the universities and research institutions patronised by the government. With public subsidy, "once discovered, an invention can be disseminated virtually without cost", and it can be shown that such 'common knowledge' products are efficient to finance publicly [Lesser 1991: 38-39, 47]. On the other hand, MNCs use the fruits of such basic research by making further investment on adaptive research for their commercial use. They cover only a small part of the total cost of research but then claim patent (that is monopoly) rights in order to exclude others from the fruits of such research.

Constantine Vaitsos sees in the patents a 'defensive strategy' by foreign companies "...to preserve markets that were once captured through exports and are subsequently threatened by competitors and/or

by the import-substituting strategies of the host countries. In this context, patents, far from providing a stimulus to foreign investment, appear to be a critical factor in blocking investments" [Vaitsos 1972: 71]. Nadal sees patents as a "powerful instrument to achieve control over markets, even without direct investment" [Nadal 1977:229; Lesser 1991: 59]. Talking about the impact of patents on agriculture, Vellve sees possibilities of higher agricultural costs and less welfare as a consequence of patenting of agricultural technologies [Vellve 1989; Lesser 1991: 60].

Further, as the experience shows, it is not usually the giant conglomerates with tentacles spread all over the world that make the earth-shaking discoveries, not even Bill Gates of Microsoft, the icon of the modern computer era. Many of the important original inventions and discoveries are made by small guys working in their tiny workshops, who sell themselves and their patented products to the MNCs as they cannot afford further costs of development and sales promotion.

TRIPs forecloses for the less developed countries of today the industrial strategy adopted by all the developed countries in the course of their development in the past, Japan and east Asian countries particularly in recent years, of liberally using foreign technologies or resorting to reverse engineering, for their own technological and industrial advancement [Hoggard 1994: 107]. For instance, Taiwan had loose or no international patent or copyright law, and followed the technology curve and product cycle of Japan, often purchasing second-hand technology. As one leading scholar on east Asia commented: "it is impossible to calculate how much of Taiwan's early growth was fuelled by the learning that went on while trying to reproduce products protected elsewhere in the world". In the early eighties US trade representative's office accused Taiwan of being responsible for 60 per cent of counterfeit and pirated items in the world market [Brautigam 1995:170].

That option, good or bad, right or wrong, moral or immoral, does not exist any more. In case of Japan and other east Asian countries 'reverse engineering' was nearly always the first step towards technological self-sufficiency, a path that India can no longer take. 'Local content requirement' was another that the former used to protect their nascent indigenous industries and to keep foreign predators away; that too is banned under Trade Related Investment Measures (TRIMs). In other words, India will have to do without the two major props these east Asian countries used in their journey towards industrialisation [Dasgupta 1998:268-70]. While the western countries and their companies are generally shy about transferring technology to the poor countries, there is a fear that IPR would further reduce such transfer and access to sophisticated western technologies [Castro 1994:52].

Patents in India

As we have already noted, patent legislation has a long history in India. Beginning in 1856, the Indian patent law has been revised a number of times [Keyala: 18]. The latest, the Indian Patent Act of 1970, recognises patent rights for a period of seven to 14 years. Article 5 of the Indian Patent Act provides that in case of inventions (a) claiming substances intended for use or capable or being used as food or medicine or drug, (b) relating to substances prepared or produced by chemical processes (including alloys, optical glass, semiconductors and inter-metallic compounds) no patent shall be granted in respect of claims for the substances themselves, but claims for the methods or processes of manufacture shall be patentable. Even in areas where patent is permitted, the government is empowered to reject patent application in national interest. Further, to prevent acquiring patent rights solely with the objective of keeping the rivals out, the government retains power to reject patent and/or to make patented products compulsorily available to users.

One major change, introduced by the TRIPs agreement, has been in relation to product and process patents . In Indian patent legislation a distinction is made between 'product' patent and 'process' patent. The Indian Patent Law of 1970 allowed process patent but not product patent, for food, medicine, agro-chemicals, etc. 'Process' means, say for a medicine, the combination of various ingredients – chemicals, medicinal plants, herbs and other biological products and so on – in specified proportions, and by using a technique or a way of combining those, that makes the production of such medicine possible. It was, therefore, possible for an Indian pharmaceutical company to buy a 'process' of making a particular medicine, in exchange of royalty paid to the patent-holder in a foreign country, but then to produce the medicine by using cheap, local material. This way life saving drugs can be sold in India at a price that is one-twentieth of their price in the developed countries.

Now under Article 28 of the TRIPs agreement this distinction between 'process' and 'product' patent has been abolished. It is the product that is patented, while the process directly used for making that product is also implicitly patented at the same time. After 2005 AD, when the deadline of TRIPs expires and the Indian law is amended accordingly, the 'product' cannot be made locally with cheap materials, and will have to be purchased from the foreign companies at exorbitant prices. As Economic Commission for Latin America and Caribbean commented: "The rules on intellectual property are a particular cause of concern, since they may raise the prices of medicines and other patented products in the short run, but may also limit access to new technologies in the longer term" [ECLAC 1994: 44]. As another expert commented: "As for the impact of life patents on the welfare of third world farmers, it is evident that patented agricultural technologies (seeds, biocides, etc) will increase production costs" [Vellve 1989].

Another controversial provision of TRIPs (in Article 34) is to reverse the burden of proof: it is for the defendant to prove that an identical product has been produced by a process other than the patented one. This violates one of the cardinal principles of Anglo-Saxon jurisprudence, that a person is presumed innocent until found guilty. Thirdly, under the Indian patent law the maximum period for which patent right can be exercised is 14 years. Now TRIPs has made it uniform and universal at 20 years. This change has come at a time when there are weighty arguments for doing just the opposite – of revising the period of patent rights downwards. These days, technologies change much faster in a matter of three or four years. To give an example, while radio and gramophone lasted for decades, the black and white TV, coloured TV, cable TV, VCR, multimedia, have come in quick succession, after every four or five years. In this situation, by the time the patent period of 20 years expires, there would be no takers for the obsolete technologies. Even computers do not last beyond 4-5 years, while software packages are revised every two years or so. To revise patent period upward to 20 years now implies that the MNCs would continue to control technological advance forever. These MNCs have sufficient money power and brain power to invest in research and development and to perpetually maintain their lead over the less developed countries, so that long before one period of patent would be over another – better and more attractively packaged – product would be launched catering to similar needs.

Fourthly, whereas life forms are not patentable under the 1970 law, after it is amended in line with the TRIPs agreement, by 2005 AD, it would have to provide patent protection for the plant and animal varieties or to take recourse to a *sui generis* system that would serve more or less the same objective [Schott 1994: 118-19]. *Sui generis* means something unique or distinct, but serves the same purpose. Among the rich countries nearly all, including the US and Japan, opted for patent system in case of plant and animal varieties. The European parliament was the last, as late as May 11, 1998, to adopt patents on life when a new law on patents on biotechnology was passed. The Indian government is also thinking along those lines.

Transitional Rules

While the amendment of patent legislation for pharmaceutical and agricultural chemical products can wait until 2005 AD, certain transitional changes were required to be made by the signatories to the Marakesh agreement before they joined the new international trade organisation – World Trade Organisation (WTO) that had replaced GATT from January 1995. Under transition rules they were asked to set out application procedures as if such protection were already available. After the transition period had expired, those countries were expected, under Article 70.8 of the TRIPs agreement, to grant applications that were filed during the transition period patent protection for the remainder of the patent term, counted from the filing date. In addition, under Article 70.9, such countries were required to grant exclusive marketing rights (generally for five years) until a decision was made on the patent application, if a patent application was made and granted in another country [Schott 1994:119].

These transitional rules, which have the effect of virtually negating the 5-11 years time periods allowed to those countries, generally came to be known as exclusive marketing rights (EMR) and mailbox (or pipeline protection). Under EMR, it would no longer be necessary for a patent-holder to apply separately to each country for patent rights. Once a product is patented in any one country, it becomes automatically and universally applicable to all the member countries of WTO, even without any examination of the validity of their claims – in terms of their novelty, non-obviousness and having practical use – by the country/government concerned. Nor would the country/government be permitted to impose conditions that safeguard the interests of the domestic industry, e g, by way of compulsory licensing rights. Every country is bound to give exclusive marketing rights to that patent-holder, who has obtained patent anywhere in the world, as long as that country is a member of WTO. In other words, patent-holder is going to have a lethal combination of two types of monopoly rights arising from patents and EMR. Given that the overwhelming majority of patents are owned by the rich countries, the benefit would accrue overwhelmingly to the multinational companies of rich country origin, and indigenous products would be driven out of the markets of the poor countries like India, e g, Indian basmati.

The mailbox provision – meaning an arrangement for receiving patent applications, mainly from the multinational countries – assumes that our patent law would be amended by the year 2005 AD, and under this the government will begin receiving patent applications in order to determine the position of a company in the queue. This is an extraordinary piece of legislation that is based on the probability of the passing of another legislation in some future date.

IV
Issue of Biopiracy

A major issue concerns patent rights on seed varieties. Under the TRIPs agreement, plant varieties are expected to be protected in one of the following three ways – by patents, by a *sui generis* system, or by a combination of the two [Dasgupta 1998:173-74].

Ever since the conclusion of the Marakesh agreement, prompted by this provision, there has been a mad rush from the large multinational firms to collect germplasms of wild plant varieties located in the less developed countries. Hordes of such multinational agri-business and pharmaceutical firms are descending on India and other countries that are economically poor but rich in biological wealth, and are scouring the countryside, forests and bushes for plant varieties. These MNCs are taking selected specimens out of the country, by means legal or illegal, and then, after some tinkering and cross-breeding with other varieties, producing new varieties that they are claiming to be unique and distinct, and then patenting those in their own countries. Once patented such varieties become the private property of the patent-holder until the time when the patent right expires. Under EMR, if the amendment discussed above is passed, the patent-holders of a product patented anywhere in the world would drive out indigenous competitors from the Indian market.

This process of stealing and plundering the biological wealth of the third world countries, which accounts for nearly two-thirds of the total, by the multinational firms originating in the west, has come to be known as 'biopiracy'. The countries rich in biological wealth and poor in economic terms account for top ranks in terms of mammal, bird and plant varieties. India figures eighth in rank in terms of both mammal and bird species, but no developed country figures among the first eight [Swanson 1997:47]. Countries topping these lists, such as Indonesia, Brazil, Peru, Mexico, or Columbia, are also ahead of the developed world in terms of diversity of plant variety. Since 1971 a network of gene banks and international centres for the assembly of germplasm collection is operating, and by mid-nineties the number of such centres became 227, spreading over 99 countries that account for 90 per cent of landacres of such crops as wheat, corn, oat and potatoes [Swanson 1997:101]. But this does not take away the need for the conservation of plant varieties *in situ*. *Ex situ* preservation is possible only for a fraction of the species, and preserve selected species not the ecosystem, and thus risks the loss of species that are reliant on the symbiotic relationship within an ecosystem [Sedgo and Simpson 1995:81].

The most talked about case of biopiracy has been the patenting of neem tree, which is a part of the Indian folk culture and whose medicinal and other properties had been known to the Indian people from time immemorial. Nor is such patenting confined to Indian medicinal plants: e g, the male sterile variety of Quinon, a high protein cereal of Andean countries was patented in the US in 1994, though it was only a discovery [ECOBP 1998:4]. The irony of such patenting is that patented products, processed by the foreign companies, would now have to be purchased by Indians who are used to getting those free in nature [Shiva and Holla-Bhar 1993]. Similar patent rights have been claimed on other medicinal plants – e g, haldi, salal, dudhi, gulmendhi, bagbherenda, karela, amla, jar amla, anar (pomegranate), rangoon ki bel, castor, vilayeti sisham, chamkura [Shiva 199:7] – whose properties had been known to Indians, as in the case of neem, from time immemorial. However, in case of haldi, another highly important plant with medicinal properties, the US medical school was forced to revoke patent on its use for healing

wounds, in 1987, after Indian protest [ECOBP 1998:4].

Recently Ricetec, a Texan seed breeding company, collected some specimens of the Basmati rice plants from India and Pakistan, then cross-bred those with some high-yielding varieties, and claimed that it had produced a new rice variety. Earlier they were selling their products as 'Texmati' (that is Basmati of Texas) or 'Kasmati' (Basmati of Kashmir), playing on the word 'mati' to attract consumers. Now they have dropped those pretensions and are selling their rice as 'Basmati' and have patented their product in the US. Similarly, patent rights have been claimed on neem and haldi among others. Under EMR, they would be able to push Indian Basmati out of the Indian market itself.

This company is making two contradictory claims: first, what they have produced is unique, non-obvious and of practical use, and distinct from Indian and Pakistani Basmati, which justified their patent application, and second, their variety is a exact replica of Basmati when it comes to taste; one eating their Basmati rice would not know the difference between he two. However, the claim that the Ricetec Basmati is novel can only sustained on the ground that it can now be grown outside India and Pakistan. While Ricetec claims Basmati-867 is an 'instant invention of a novel rice line', in fact it only made use of conventional breeding methods [Shiva 1998b:4]. The company's claim that the invention "is based on the surprising discovery that certain Basmati plant and grain characteristics and aspects of the growing environment for traditional Basmati rice lines are not critical to perceived Basmati product quality by consumers"is equally dubious [Shiva 1998a:2].

The developed world doublespeak is also revealed in the way they refer to the 'common heritage of mankind' [Lesser 1991:64]. The developed countries demand that all germplasms be recognised as a public resource and a part of the heritage of the mankind. That would give them the right to collect germplasm in the wild or as landrace varieties without compensation on the ground that these belong to the 'common heritage of mankind'. But, after improving the variety through research and experimentation, they do not hesitate to sell these against payment to countries including those from which such germplasm had been originally collected [Lesser 1991:64]. This attitude of developed countries has led the less developed countries to make two specific demands: first, that the companies collecting those germplasms should pay to the local communities to which they belong, and, second, in line with the 1993 convention on biodiversity, these should be treated as coming under the sovereign right of a nation and not as something 'international' and belonging to nobody in particular [Lesser 1991:64].

One way of countering this type of biopiracy is to take resort to the concept of 'prior art', i e, some evidence that what is being claimed as 'novel' in the patent application was known already. The major difficulty here is that the US courts insist on documentary evidences of such 'prior art' that is difficult to find in a society where 'oral tradition' dominates. Another solution to the problem of biopiracy that suggests itself is to patent the Indian plant varieties in India itself, before it is done by anyone else and thus save them from poaching, ie, to play the game by the rules of these predator firms, but quickly and more efficiently before further damage is done. The snag in following such a step is that patenting involves individualisation of rights, whereas plant varieties like those relating to neem, haldi or Basmati were evolved by a large number of small communities of farmers, spread over a large area, working collectively and sharing their discoveries with others, and over a period of several centuries. How would one find the 'owners' of those plant varieties in terms of intellectual property rights, when all those who played some role in their development – through selection and adaptation of plant varieties, but without erecting any barrier to the flow of information within or between these communities – constituted what could be described as, following Vandana Shiva, 'Intellectual common'?

Many argue that life cannot be patented, or otherwise subjected to individual ownership; companies like Ricetec are not 'inventing' anything, but are merely 'discovering' what had been known in India or Pakistan from time immemorial. These are not like machines to be invented, but life forms that cannot be created. Rights on those varieties belong to these communities. Obviously communities, working separately and independently, cannot exercise their rights on their own and protect varieties against agencies such as MNCs, which are out to encroach on them. In a sense the government of a country is sovereign as the custodian of the interests of these communities and the individuals. Several UN resolutions, such as the 1975 UN resolution on 'Towards a New International Economic Order', and the 1993 Convention on Bio-Diversity had recognised these rights of the governments over natural, mineral and biological resources.

One opinion is to work out a balance between the right of access by foreign firms, for the purpose of what they describe as 'bio prospecting', and the recognition of the right of the community to this biological resource. About a quarter of the pharmaceutical products marketed by the US firms are plant-derived, but the communities remain unpaid despite such massive use of their resource. Some would prefer some compensation, or benefit-sharing or royalty to be paid for this use to the community [Swanson 1997:103]. Some others are sceptical that adequate compensation can be estimated or paid given the gross disparity between the two sides – the community and the company in terms of resources, knowledge and influence.

On the other hand, there are those who feel that, without some form of recognition of individual rights – in the form of patent or some *sui generis* system – given the international climate, India would lose out. The international climate was not that unfavourable until recently as, unlike the US and Japan, Europe did not recognise patent on life form. The European patent law under Article 12(1a) excluded for ten years from joining convention, food and pharmaceutical products as such and horticultural and agricultural processes in general [Armitage and Davis 194:12]. India and other third world countries could seek and possibly obtain the powerful support of the European countries during TRIPs review in 2000 AD. Patent laws in every European country, based on European Patent Convention (EPC), excluded in absolute terms patents on plant and animal varieties in order to preserve free access to research and develop a diverse range of options [ECOBP 1998:5]. But as the following account would show, India made no attempt to take advantage of the European position, and now Europe too has followed the line of the US and Japan by patenting life form.

Debate in European Parliament

The climate of opinion changed in Europe in 1997, mainly under pressure from its own pharmaceutical and biotechnology industries, that without patent on life form Europe was falling behind the US and Japan. In August 1997, a directive (which is the name of European legislation) was drafted by the European Commission, accepted by its council of ministers and then forwarded to the European

parliament. As it is the practice in the European parliament, this directive was subjected to two readings. During the first reading, those members of European parliament (MEPs) who were in principle opposed to patent on life found many allies and together moved many amendments. Of these 66 were accepted by the European parliament, including one (known as Amendment 76) against biopiracy [ECOBP 1998:1].

Amendment 76 required evidence of compliance with legal access and export provisions in the country of origin of the genetic material, where animal or plant genetic material was used in a patent application [ECOBP 1998: 3]. Though far from perfect, this amendment was the best that could be achieved under the circumstances, according to those opposing biopiracy. If the amendment was passed, it remained within the rights of the Indian government to legislate on export of genetic material that could stop biopiracy as far as Europe was concerned.

When this amended directive was sent back to the European Commission and council of ministers, the latter accepted 65 out of those 66 amendments, but changed those beyond recognition while revising. The amendment they did not accept was the most crucial one from the Indian side, i e, Amendment 76 on 'biopiracy'; the Commission's view being that it was already incorporated in the recital that the directive would comply with CBD and that nothing more was needed [ECOBP 1998:3].

Among the countries Italy voted against this attempt to legalise biopiracy, the Dutch and Belgian governments abstained, and while the Danish government did not oppose it in the council of ministers though its MPs were opposed to biopiracy. Among the political formations, the Left-wing and Green parties opposed biopiracy, while the socialists were divided almost right down the middle. To get the amendment through during the second reading 315 votes were needed, while those opposing patents on life or at least wanted biopiracy to be stopped, had about 286 votes. It was a matter of influencing 30 odd votes.

In the last week of April 1998, the author and Indira Jaisingh, a prominent lawyer of the Indian Supreme Court, went to Brussels at the invitation of the Dutch coalition against patents on life and Gaia foundation of London, and met a large number of MEPs. While we could identify a core of committed MEPs who were strongly opposed to biopiracy, some others expressed reservations. Some of them were saying, rather apologetically, that Europe had to survive in a competitive world with the US and Japan, and had to have something in place to counter the US and Japan. Some were sick and tired of discussing this issue again and again, did not care about what the final outcome of the debate was going to be, and were keen to get this directive out of the way. Some asked why should we, from outside Europe, be so interested in an European legislation, when our first priority should be to have good legislation of our own against biopiracy. We pointed out that even with the best legislation in the world, that Indian legislation would only protect our interests within the country, while what was happening in Europe and the US would influence our exports.

Before going to the European parliament, the amended directive had to go through the subject committee, the committee on legal affairs, and not by committees on development (whose chairman Rocard, a former prime minister of France, assured us that in his committee the deliberations would have been more substantive) or agriculture. However, both Jaisingh and I were allowed in during discussion in that committee. The chairman formally noted our presence and quite a few participants in the meeting referred to our presence and to the note we circulated among MEPs. But the discussion was purely technical and legal in nature, did not touch the substantive issues, and at the end all the amendments suggested by those wanting to stop biopiracy were defeated. Rotley, who piloted this directive through the committee said that what Ricetec had produced was something different from Basmati and therefore was patentable; what was debatable was whether the name Basmati should have been given. But then, he added, it was a matter of bad luck that India did not protect its name and so allowed the name to be patented.

It has been argued that here the issue is not only on geographical indicators (such as the case with champagne in France or Darjeeling tea in India). Geographical indicators will only prevent the use of name Basmati, but will not prevent patenting based on our Basmati. It cannot be done with thousands of varieties that are grown over a large area [Shiva 1998b:3]. According to the US case laws, once a patent is granted for a genetic trait (say aroma) all occurrences of that trait will be considered an infringement irrespective of how they came to exist. A 1985 judgment allowed Kenneth Hibberd to exclude others from using 260 aspects of tissue culture seed and whole plant of a corn line selected from tissue culture. With this judgment, a judicial framework was set in place that allowed the seed industry to claim royalties from farmers planting saved seed, as patents cover regenerative capacity of the seed to make new plants. Another 1994 judgment, Imagio Nursery vs Daina Greenhouses, ruled that a plant patent can be infringed by a plant that merely has similar characteristics [Shiva 1998a:2].

It was clear from the responses that most of the MEPs had been subjected to intense lobbying from MNCs of agri-business and pharmaceutical varieties, far exceeding what could be doen by the Left and Green parties and NGOs concerned with environment and the role of MNCs. They even organised front groups: such as patients of difficult diseases, sitting in wheel chair and chanting 'no patent, no cure', conveniently ignoring the fact that for the vast majority in the poor countries like India patents would imply a 20-fold or 30-fold increase in the prices of life saving drugs [ECOBP 1998: 1]. One major reason for this hightened interest in patents on life is the success with biotechnology and genetic engineering in recent years. and the possibility that the later has created to transfer genes between unrelated species. We are refraining ourselves from that discussion as it would take us away from the issues we are focusing here.

European Debate and India's Inaction

Our impression was that a strong intervention from the poor countries led by India, preferably jointly by India and Pakistan, the two lands of traditional Basmati, could have just tilted the balance in favour of this amendment on biopiracy, as the difference between the two sides was not large, a matter of around 30 votes. However, the Indian embassy at Brussels did not seem to have the faintest clue of what was going on. The ambassador agreed to send my faxes to the prime minister and the ministers in charge of agriculture, industry, commerce and external affairs, urging immediate and strong intervention, as the time was running out.

When I returned to India on May 9, the minister of agriculture Sompal, whom I had known for a number of years, informed me that my fax indeed reached the government on April 29, but during the intervening ten precious days nothing was done except that he had circulated my fax to all the ministers seeking their opinion. The minister of industry, Sikandar Bakht, whom I hold in high regard despite serious differences in political perspective, was

somewhat more positive and wrote to me saying that instructions on the lines suggested by me had been sent to our embassy in Brussels in order to mobilise opinion among MEPs. That letter was dated May 9, too late for any action to have effect on deliberations in the European parliament on May 11, the day the biotechnology bill with no safeguards against piracy was adopted. As a matter of coincidence, this was also the day when nuclear test was conducted at Pokhran.

Sui Generis, Plant Variety Legislation and UPOV

As things stand now, following the TRIPs agreement, India will have to provide patent protection to plant varieties by 2000 AD, or choose a *sui generis* system, or a combination of both. *Sui generis* system is something that is unique, that a country has adopted on its own, but which provides protection to plant varieties. This provision sounds quite generous, but when it comes to brass tacks, it does not make much difference from the patent system. As in the patent system, the understanding in fund-bank-WTO circle is that *sui generis* too would allow for individualisation of rights on plant varieties. Establishment or private property in village common, water, plant and other major inputs of agriculture, and even on national parks and highways, in place of communal ownership, is considered by this trinity to be essential for safeguarding environment. A combination of privatisation of rights, appropriate pricing that reflects the scarcity value of a product, and an efficiently functioning market, they claim, can solve all the environmental ills. Since we have elaborately discussed this issue elsewhere, here we are desisting from engaging ourselves in an analysis that would show why this view is wrong, and is indeed dangerous to our biological wealth [Dasgupta 1998:215-27].

One alternative usually suggested in India, as a kind of *sui generis*, is to adopt UPOV (International Plant Breeders' Rights Convention), a soft patent regime that arose from an international convention in 1961, supported by 37 countries [Lesser 1991:17-19; Gaia 1998: 1]. UPOV was twice amended, in 1978 and again in 1991, and the option to join the 1978 option closes in April 1999. The official arguments given in support of UPOV are as follows: (a) that it would give the country two alternatives – UPOV and WTO-led TRIPs – to choose from, (b) that this would encourage investment in plant breeding from domestic and international sources, as breeders would get protection with minimum formalities and costs, and (c) that it would help to avoid numerous bilateral agreements, while the need for a *sui generis* in place of patents would be satisfied.

A major criticism of UPOV is that it protects the interests of the plant breeders, by giving it monopoly rights that are analogous to patents, while ignoring those of the farmers and making those secondary to the former. Under its 1991 version, if the farmer fails to pay royalty his harvest can be seized by the breeder. The right of the breeder over the plant variety is an individualised one, while the community rights have been ignored and the right to reuse and exchange seed by the farmers has been severely restricted. UPOV too is in conflict with CBD, as uniformity of seeds is a criterion for the recognition of the rights of the breeders [Gaia 1998:5-11]. A major reason for concern is that already 40 per cent of the seed market is in the hands of ten companies, and UPOV might reinforce this tendency towards concentration. This would give MNCs legal ownership of plant varieties that contain genetic information obtained from farmers' own fields, obtained in many cases without paying any fee [Gaia 1998:7].

There are complaints that plant breeders are charging high prices under UPOV. This international agreement has allowed plant breeders to claim exclusive marketing rights in varieties developed by them by crossing the previously existing ones. This has revealed a serious dichotomy – whereas access to raw germsplasm, gathered from the poor countries and stored in gene banks is virtually free, the improved germplasms patented in the rich countries by rich country companies are being sold to the less developed countries at high prices [Swanson 1997: 102]. This controversy led in 1986 to the less developed countries seeking recognition of 'farmers' rights', and for an international mechanism to give effect to it, though so far nothing concrete has been done to achieve this [Swanson 1997:102].

Bio-Diversity Legislation

A bio-diversity legislation is expected to fulfil two requirements: (a) conforming to Convention on Bio-diversity (CBD) of 1993, and (b) safeguarding Indian biological wealth against bio-piracy. The first draft prepared by the ministry of environment, after wide consultations, was brushed aside and a new draft was prepared on the basis of the report of an expert committee, headed by M S Swaminathan, the famous agricultural scientist. The draft gives easy access to foreign firms, including those to 7,500 highly valued indigenous medicinal plants, in exchange of a fee to be paid to the community in the name of 'benefit-sharing'. Though it is projected as an attempt to balance the rights of the foreign firms to have access with those of the communities where such plant varieties are located, as in most other cases there can be no level playing field between the two sides. The idea of benefit-sharing would allow the all-knowing and powerful multinationals to pay a small amount to the innocent and unknowing communities having no idea of the economic price of their resources, in order to gain the right of 'bio-prospecting' and thus to arrogate to themselves the rights of these communities. In the long run, this benefit-sharing might force India to pay out a great deal more in the form of royalties for buying those plant varieties, now patented elsewhere, than what the country would obtain from such paltry 'compensations' [Shiva 1998b:2]. One suggestion is to force the companies concerned to compensate the farmers from a fund created from royalties earned from such patents by the companies [Lesser 1991:64].

Further, this draft does not explicitly recognise communities, but talks about 'persons' with whom benefits would have to be shared by the companies. The amount of compensation for access to be paid by the foreign companies would be decided by a national bio-diversity authority to be set up under the bill. It also stands in contrast with an article in panchayat (extension to the scheduled areas) act of 1996 that provides that state legislation should be in tune with traditional management practices relating to community resources. Worse still, it does not explicitly take into account national sovereignty and indigenous knowledge, and in the name of conservation, might even be used (as in the case of forest legislation) to deny access to the local communities.

Role of Multinational Agri-Business Firms

In India most people have no idea about how powerful, and how potentially harmful, these multinationals are. These are very large entities, the largest among them having annual turnover figures that are close to the national income of a country as big as India with 96 crore people. They offer the highest salaries and, therefore, attract the best of brain power in the world: engineers, mathematicians, chartered accountants, managers. Because their tentacles are spread to practically all the countries of the world, through affiliates

and subsidiaries, they aim at profit maximisation at the global level, often at the cost of the interests of the host nations, and can effectively hide their illegal transactions in terms of 'book-keeping' transfers between affiliates [Dasgupta 1998: 195-203].

They also operate vertically – in case of an oil company, from searching for oil to its marketing through development, production, refining and transporting – and also horizontally, in collusion with other oligopolistic corporate giants operating in their fields. Empirical evidence amply confirms their shyness in transferring technology or in bearing risk in entirely new areas. The Indian enterprises would be no match for them in competition, and there could be no level playing field between these giants and the Indian dwarfs, as observed by Mahatma Gandhi in another context [Dasgupta 1998: 195-203].

The new patent regime would provide them with monopoly to sell their commodities in Indian market, and no Indian or competing foreign enterprise would be able to market those in India. Product patent rights together with the monopoly marketing rights in the hands of the multinational companies would become a lethal combination that would destroy Indian industries and eliminate any hope of achieving self-sufficiency or development. The period of patent – 20 years – would be too long and by the time it ended, the multinational companies would be ready with some new, more fashionable, more attractive and more user-friendly product to reduce the release of patent right to a matter of no consequence. In east Asia the governments carefully kept these predators out of the way of the nascent indigenous enterprises in the same field, by invoking 'local content requirements' that made heavy demand on the foreign enterprises in terms of deployment of local manpower, material and so on, or by high tariff, prohibition or quota restrictions. Such local content measures cannot be implemented now by India, as trade related investment measures (TRIM) under Marakesh agreement rules out these measures and demands that the foreign companies be accorded 'national treatment' and no discrimination be practised against them.

Even during the British colonial rule the British economic interests seldom directly participated in agricultural production, except in plantations located in sparsely populated areas. Now the multinationals are planning to enter India's countryside in a big way, by taking part in wasteland development and also by linking their processing activities (e g, with respect to tomato) with direct agricultural production. As they have done in other countries, they will follow two parallel systems – plantation and contract production. In plantations they will work with their own hired labour, while under the contract system they would give inputs and technology to the contract farmers, would expect them to operate under their specification and norms, and to deliver their products to the company. The prices of both inputs and outputs would be determined by them and imposed on the farmers, who would lose their independence.

Supply of Terminator Seed and Other Inputs

Apart from production directly linked to processing, for the rest of the agricultural economy the multinational agribusiness firms wish to become the main supplier of seed and other inputs. Here too they would try to make the farmer completely dependent on their supply. Recently, these agri-business companies have developed what is significantly known as the 'terminator technology'. This technology makes the seeds sterile, i e, incapable of being used for the second time for germination. The objective behind developing this technology is not to allow the peasants to use the same seed again and again and to force them to go back to the multinational companies for new seeds every year. While agriculture is synonymous with regeneration, renewal and reproduction, this technology strikes at the base of such predominant features of agricultural life making seeds infertile and unsuitable for multiple use. More dangerous is the fear that, even in cases of those who do not use this 'terminator' seed, pollens from the latter would spread over a very large area and would make even other seeds infertile.

Apart from the terminator technology, those relating to fertiliser and chemicals are also making the peasants further dependent on MNCs for supply in place of self-reliance practised in the past. They are developing weedicides that are specific to a particular seed variety that it would not harm. Such weedicides would make it possible for the farmers to spray chemicals even when the crop is standing. Similarly, fertiliser and pesticides specific to a particular seed variety is being produced. In other words, the farmer would be forced to depend exclusively on a package of seeds, chemicals and fertilisers supplied by a particular MNC.

Over time, the concerned MNC, by investing an enormous amount on R and D, will do everything to make the peasants perpetually dependent on it, by producing new packages every few years. As we have noted, in the background of the spate of suicides in Punjab and Andhra Pradesh many chemicals are spurious and adulterated. Yet, MNCs push the farmers to use these chemicals more than is good for the plant itself. In the mid-1980s, 30 farmers of two of the most prosperous cotton growing districts of Andhra Pradesh committed suicide because the pesticides killed off the main target pest, which allowed other pests suppressed by the main pest grow at an alarming speed and destroy the crop.

V
Political Economy of Patents: The Indian Experience

Short Term: Transitional Rules on EMR and Mailbox

The patent issue, which has become a highly controversial political issue in recent years, carries both short-term and long-term implications. We begin by examining the short-term ones relating to the transitional rules concerning EMR and mailbox.

These two preconditions for WTO membership were fulfilled by India on January 1, 1995, when it became a founding member of that powerful organisation in a way that became highly controversial. Though the Indian parliament was in session until the early fourth week of December 1994, no such legislation was proposed. But as soon as the parliament was adjourned, the government issued an ordinance that incorporated these two entry conditions and joined WTO from January 1995. Since ordinances are laws as long as these are in force, "having the same force and effect as an Act of Parliament", this measure helped India to satisfy the WTO entry conditions quite legally [Rama Devi and Gujar 1996: 33-34]. The question arose whether it was ethical to bypass the Indian parliament and thus, to avoid national debate on such a major issue by taking recourse to ordinances.

In many countries, including the US, international agreements are required to be placed before its legislature for ratification, and there have been cases where the US Congress had refused to ratify such international agreement. The Havana charter for the formation of the International Trade Organisation, prepared in the late forties and in the early fifties, failed to get the approval of the US Congress, and therefore the idea was

ditched. It was revived in a grossly modified form after several decades, with the formation of World Trade Organisation. The US objection to ITO had something to do with the international trade environment in the early fifties and the role the Soviet Union was likely to play in it. Similarly, the active US sponsoring of WTO had something to do with the fact that the Soviet Union was no more.

The point we are making here is that while the US government cannot participate in any international agreement bypassing its legislative bodies, in India such ratification by legislature is not deemed necessary. In fact, section 102(a) of the US Trade Act states categorically that in case of any conflict between a provision of the Uruguay round agreement and a law of the US, the latter would prevail. Nor would the Uruguay round agreements "limit any authority conferred under any law of the United States, including section 301 of the Trade Act of 1974, unless specifically provided for in this Act". Further, under section 182(4), even when a foreign country is working in compliance with the provisions of the TRIPs agreement, action can be taken against it, under the US trade legislation if the US trade representative finds that it has denied adequate and effective protection to intellectual property rights [Keyala 1998:86-87].

Thus, the US legislation makes it abundantly clear that, in matters of trade, they would be principally guided by their own perception of self-interest, and no international agreement can be imposed on them without their explicit approval. In contrast, the people of India were not a party to the fulfilment of these two preconditions for membership by way of ordinance; they were not consulted. Further, the Indian legislature is being asked to change their domestic laws in line with the provisions of an international agreement without in-depth examination of its provisions to ascertain whether these accord with national interest and without the benefit of a national debate on this.

Devious Means to Get the Bill Passed

However, any ordinance issued by the government when the parliament is not in session is required to be approved by the parliament within six weeks of the next parliamentary session [Rama Devi and Gujar 1996:534]. When the government attempted this, it faced a serious difficulty. While the government had a small but working majority in Lok Sabha (the lower chamber of the Indian parliament) and got the bill validating the ordinance passed, in the Rajya Sabha (the upper chamber) it had no majority. Unlike Lok Sabha, Rajya Sabha is never dissolved, and one-third of its members retire every two years. As a consequence, its composition does not radically change with elections. In 1995 (and also in 1999, more or less) of the three major forces – Congress, BJP and the Left and other parties – any two together was larger than the third. With BJP joining the Left parties and the Janata Dal on this issue, as we have noted already, there was no way that such a bill could be passed.

Given this, the government engaged itself in a series of manoeuvres to secure a majority by hook or by crook. For instance, though the proposed bill on patents was on the list of business of the House for weeks, it was not actually brought before the House for discussion and voting. Then, on March 22, 1995, the item was taken off the agenda, giving the impression that the government was no longer interested in this.

But, on the same day, immediately after a short afternoon break following the conclusion of discussion on another bill, suddenly this bill was put as an additional item on the agenda by a supplementary notice. The government was hoping to catch the opposition by surprise and to take advantage of the thin attendance of the opposition members, many of whom had assumed that the business of the day would be over soon after brief discussion on a less than exciting bill on workmen's compensation. The attendance of the treasury bench was boosted by a promised dinner to be hosted by the prime minister that evening [Dasgupta 1995].

This attempt to get the bill passed failed, as the opposition members went into the well and forced adjournment. Next morning, a meeting of the party leaders was held at the residence of the deputy chairman, where it was argued from the government side that this was an international obligation and, therefore, could not be reneged, while the opposition argued that it was never a party to that agreement as it was not consulted and the matter was never discussed in the parliament. Afterwards, in the parliament, the prime minister Narasimha Rao admitted to a meeting of party leaders that the bill, if presented to the House, would be defeated and there was no way that the ordinance could be validated within six weeks, and sought the co-operation of the opposition in ensuring that the government did not lose its face in the eyes of the world. The formula he proposed was for a leader of opposition to state in the House that they needed time for considering the bill. Some of the opposition leaders did oblige him by saying so in the House, but some others refused. If any one thought that the issue was over, he was proved a fool when in the late afternoon the minister of parliamentary affairs, Vidyacharan Shukla, who was in charge of the bill from the government side, suggested a special session on Saturday to get the bill passed [Dasgupta 1995].

When this attempt too was frustrated, the government agreed to set up a select committee; but then, contrary to convention and an explicit agreement with the opposition, loaded the select committee with more than proportionate number of its supporters. The government then got the list of select committee members passed in the middle of a discussion of a private member's bill on a Friday afternoon, again breaking another time-honoured convention, in a thinly attended House, and taking advantage of the absence of opposition leaders, by deliberately lying to the member chairing the session at that time (in absence of the chairman and deputy chairman), that it was the consensus of the leaders of all the parties. Furious by this dishonest attempt to sneak the bill in, the opposition boycotted the select committee. The ordinance lapsed and the issue was shelved for the time being. Though, later, the select committee was reconstituted in accordance with the demand of the opposition, its work was stalled because of other developments that overtook Indian political scene. By then, the telecom and hawala scandals had stolen the limelight and the election was in the horizon The government, realising this, did not make any further attempt to get the bill passed again [Dasgupta 1995].

From then onwards India was in an anomalous position of having attained the WTO membership by fulfilling the two conditions of EMR and mailbox by way of ordinance, any by not fulfilling those any more as the ordinance had lapsed. Eventually the US government raised the issue before the Dispute Settlement Board (DSB) of WTO, and after lengthy deliberations, where the Indian case was not well presented, DSB gave India 14 months (that is up to April 19, 1999) to amend the national patent bill and incorporate those two conditions of EMR and mailbox in it. This is the 'external compulsion' that the present minister of industry, Sikandar Bakht, who is piloting this bill now, has been referring to again and again in recent months.

April 19 Deadline: Possible Consequences of Its Non-Fulfilment

What are the possible consequences of not meeting the April 19 deadline and leaving the two pre-conditions on EMR and mailbox unfulfilled? In the meeting at the residence of the deputy chairman in 1995, mentioned above, the government side warned that the failure to ratify the ordinance would lead to India's expulsion from WTO. That was untrue, as the entry conditions were not linked with expulsion for non-fulfilment of such obligations at a latter date. One way or the other, India is a member of WTO, and the procedure for expulsion are to elaborate and cumbersome to be tried against India. India cannot be thrown out of WTO simply because of non-fulfilment of transitory rules. Over the last four years no country, not even the US, has proposed India's expulsion.

Secondly, even though economic penalties can be imposed, that too is time consuming and is likely to be as ineffective as the economic sanction by the US after the Pokhran nuclear test. Such sanction is a double-edged sword and is likely to hurt the developed countries imposing penalty as well, the potential of Indian market being assessed highly by the multinational corporations. To impose an economic penalty, a country suffering damage from such non-fulfilment of WTO conditions, say the US, has to apply again to WTO. Under the WTO agreement, 20 days are given for request for retaliation, 30 days for authorising such request, and 60 days for final arbitration, and if all these are taken in quick succession, still it would involve about four months [Schott 1994:127-28]. A team of good lawyers can easily stretch it to one year, the time for the international review of Articles 27.2 and 27.3 in the TRIPs agreement.

The fact is that the US is as keen to retain its markets in India as some others are to take over a part of it, should the US withdraw. Italy under a left-led government, France, Germany and Holland, are among the countries that are likely to take full advantage of US dissociation from the Indian market by way of economic sanction [Mcleland and O'Toole 1987:246]. This is precisely why in spite of keeping India at least thrice on its Super 301 hit list for failing to open the insurance market to US multinational companies, the US did not carry out the threat of economic sanction. Further, though India has failed to fulfil WTO preconditions for membership since April 1995 for four years, no action has been taken so far.

One can also add that, among all countries, the US is by all counts the most serious violator of GATT/WTO rules. At the time of the establishment of WTO along with its procedures for multilateral sanctions, it was expected that these would obviate the need for the US to rectify its grievances through unilateral actions. That expectation has been belied. We have already noted that the US has made it abundantly clear that the decisions of WTO would not be binding on it, and Super 301 as also Special 301 (actually Section 1303 of the US Trade Act that is specific to intellectual property rights), both of which had always been in gross violation of GATT norms, would continue to operate alongside sanctions by WTO.

Of course, theoretically, countries adversely affected by the US violation of WTO norms would have the right to retaliate against the US under the WTO rules, but such right can never be meaningfully used given the wide disparity in their trade powers. As one scholar commented: "most countries simply do not present the US with a credible threat of retaliation; the US market is too important for them to risk". In sum, the WTO can reprimand but not severely punish violations by major trade powers. "When they regard it as necessary, big countries can still abuse the system". such inequity is built into the trade system now controlled by WTO [Low 1995:64: Schott 1994:129-31].

BJP Government and the Changed Political Scenario

For nearly four years the patent issue remained frozen as the Indian political system went through a number of experiments, particularly the two-year rule by United Front some of whose major constituents, the left-wing parties in particular, were hostile to any idea of amending the patent legislation to conform to WTO requirements. The accession to the government by the BJP and its allies in 1998 after a general election created a new situation since now the BJP, who opposed the transitory rules in 1995, was in the government and therefore, was under strong pressure from WTO, World Bank and IMF. While in 1995 Atal Behari Vajpayee walked out of the Lok Sabha along with other non-Congress opposition party members in protest against the passing of this bill, in 1998 he, as the prime minister, was keen about fulfilling what he describes as the 'international obligation'. Further, while in 1995, with the Congress in the government, the main opposition party, BJP, opposed the bill, this time, the Congress, the main opposition party, was supporting bill and appeared to be more enthusiastic than the government itself to get the bill adopted by the parliament. With the support of the government and the main opposition party behind it, and given the arithmetic of the parliament, there can be no question this time of the bill being defeated in either house. Yet, the questions remain (a) why BJP changed its position, and (b) why Congress is so keen to see the bill through.

As for the first question, this confirms once again that when it comes to class issues as reflected in the economic policies, there is nothing to choose between the two major parties, both reflecting the interests of landlord and bourgeois classes. Both are united in not allowing the long pending agricultural workers' bill to be passed or land reform to be carried out, and are seeking to convert Foreign Ex-

change Regulation Act (FERA) into innocuous Foreign Exchange Management Act (FEMA) that makes violation of foreign exchange regulation a mere civil offence, and to pass a money laundering bill that takes no account of over- and under-invoicing and Hawala or Bofors type issues. In recent months the BJP has been busy completing the tasks of globalisation left unfinished by the previous the Congress government – such as the bill to allow privatisation and internationalisation of the insurance business, to permit Enron and other power companies' guaranteed profit, and to reform Companies Act and various labour laws.

Such developments also demonstrate that the slogan of 'swadeshi' was a gigantic hoax. Immediately after the 1998 election, the new finance minister was sent to Washington to assure the global superpower that swadeshi was an election gimmick and was not meant to be implemented, that they would continue with Fund-Bank 'reform' package, and that they would not allow anything to stand in the way of globalisation, and indeed would expedite globalisation. During the period immediately following the Pokhran nuclear test – when the full throated public rhetoric of swadeshi, 'maryada' and sense of national dignity was jarring the ears – the BJP government began giving large concessions to US, Japanese and British multinational companies so that they would induce their own governments not to implement, and eventually to withdraw, economic sanctions against India.

However, BJP as a party was far from united on this issue. Interestingly, the least socially tolerant and RSS-inspired element within this party, mainly those associated with the Swadeshi Jagran Manch, articulated their worry about the possible harmful impact of globalisation by way of patent and insurance bills on the indigenous industry almost in a way the left parties were putting forward their views. They expressed their opposition to the amendment bill – inside the party as also by way of their utterances and behaviour outside – during December 1998 discussion in Rajya Sabha. Even after the bill was passed in the Rajya Sabha on December 22, 1998, they induced the government not to present it before the Lok Sabha, the other chamber of the Indian parliament, for approval on the 23rd, the last day of the winter session, as they thought that more time was necessary for a careful consideration of the bill. Since then, over the next four weeks of so, they have been won over, mainly on the ground that not supporting the government on this bill would make the government lose face both within and outside the country and would expedite the downfall of a government already crippled by dissension within the coalition.

Rationale behind Congress Support

The Congress, though the main opposition party, has been visibly more keen to get the bill through than the government itself. At one stage in the last week of December 1998, the BJP minister of parliamentary affairs, Madanlal Khurana, told the press that the bill would be sent to a joint select committee for a detailed examination of its clauses as demanded by the Left and Democratic parties, but within half hour that decision was reversed. The minister explained this volte-face in another hurriedly called press briefing that the bill would not be sent to any committee but would be passed directly by both, as the Congress, its ally in the endeavour to get this bill passed, was against sending it to any committee.

The senior leaders of the Congress Party feel that BJP's 180-degree turn on the bill has exposed its opportunism, and has provided them with considerable electoral advantage. Further, their leaders see it as their own bill that they could not get through in 1995 because of Left-BJP opposition. Their own support for the bill demonstrates their consistency, as opposed to the opportunism of the BJP. Moreover, following their good showing in the mini-general election in four states a few months back, they are sensing victory in the next general election. They would now like the BJP to do all the 'dirty work' for them, such as getting the controversial bills on patent and insurance passed. That would enable them if they win, to begin with a clean deck, while blame would be put on the BJP for sponsoring these bills and getting those passed.

There is also another Machiavellian angle in this. The Congress knows that once they are in the government and the BJP is pushed to opposition ranks, there is every likelihood that the BJP would again take the side of the other opposition parties and defeat this bill. The only way this bill can be passed, they feel, is by the BJP being in the government (as Sikhandi of Mahabharata) and being supported by the Congress from the opposition on this issue. This consideration has raised suspicion, quite rightly, in a section of the BJP, that once the bill is out of the way, the Congress would do everything to bring down the BJP government, which is not a difficult exercise. One argument making rounds in the BJP circles is that this bill is the lifeline of the BJP government. As long as the bill remains hanging, the Congress would not do anything to bring the government down. This was possibly one of the reasons why on December 23 the BJP government did not place it before the Lok Sabha for approval and allowed the session to come to an end.

Obviously there was dissension within the Congress too. While leaders like Manmohan Singh and Pranab Mukherjee were pushing hard to give full support to the bill, the official spokesman of the party, Ajit Jogi, said repeatedly until the morning on December 22, that the party had taken to decision. Some senior Congress members introduced important amendments to the bill, and one of them had to be shouted at by the party chief whip to dissuade him from formally moving an amendment on the floor of the House. At the time of writing this paper, the leaders of both of these two major parties seem to have succeeded in bringing their houses into order: the BJP leadership saying that the prestige of the government is at stake and the Congress leadership saying that (a) it is their bill that BJP is moving, and (b) the party is committed to globalisation in this form. It is more than likely that no flag of revolt would be raised during the budget session in February when it would be placed before the parliament for approval.

The Left and Other Opposition Parties

There is no ambiguity about what the left and other non-Congress opposition parties wanted. First, they demanded that this bill should be sent to a select committee of Rajya Sabha, or to a joint select committee of the two houses of parliament, or to a standing committee. Despite WHO pressure, these parties argued, there was no need to rush the bill through the parliament in December 1998. The winter session continued until December 23, but the parliament would again meet in the last week of February, and the intersession period could be fruitfully used to consider in detail the highly complex issues that were arising with regard to this bill by referring it to a standing committee or a select committee. The committee system was introduced in order to enable clausewise and in-depth examination of complex bills. The committees can invite experts and seek their help in their deliberation and can give a considered view in the form of a report.

If there was any bill that fully qualified for such examination, they argued, it was the patent bill and, for a number of reasons. First, the bill is loaded with legal,

technical and economic jargons that only a few parliamentarians would be able to follow by simple reading. Secondly, this bill carried serious long-term implications, and was likely to influence in a massive way the course of development in the years to come. When so many bills are sent to such committees, it was ironical that the government was unwilling to subject this bill, perhaps the most important of all, to clausewise parliamentary scrutiny by any committee before taking the final plunge. Not only the government rejected such demands from non-Congress opposition, they were not willing to allow more than two hours of discussion on the bill on the floor of Rajya Sabha, though eventually they were forced to extend it to 10 hours.

The third major point is related to the centre-state relationship. While 'patents, inventions, and designs, copyright, trade marks and merchandise marks' are covered under item 49 in the union list of the seventh schedule of the Indian Constitution, the two subjects most likely to be affected by the amendments to the patent bill – public health and agriculture – are covered under items 6 and 14 in the state list of that schedule (Government of India 1991). So, the left-led opposition proposed that the states and their chief ministers should be consulted on this bill by convening the meeting of the inter-state council (Article 263) or of the national development council, of which they are members. Not to do that would amount to violating the federal character of the government, it argued. Five chief ministers wrote to the central government seeking such consultation, but evoked no response.

Though the bill this time (1998) got through the Rajya Sabha, the more difficult of the two houses from the point of view of the government, the non-Congress opposition earned a moral victory and further demoralised the BJP ranks, who were already badly divided on the issue. The BJP government decided not to get the bill through Lok Sabha next day, the last day of the winter session. This provided the government with an opportunity, if they so desired, to use the intersession period for a clausewise examination of the bill by the standing committee on industry, which might be asked to give it priority and to produce its report by mid-February, in time for the budget session and long before the April 19 deadline. The BJP government did not make that choice and instead went for an ordinance again. That would imply that they are seeking to get the ordinance ratified, by both the houses, in the budget session beginning in the third week of February.

TRIPs Review in 1999

What should India's position be on this issue? It is possible to take a mini-max approach, striving to undo as much of the damage done to us as possible, while keeping an eye on the minimum that can be achieved even within the WTO framework should a drastic revision of the Marakesh agreement become politically unfeasible. Much depends on the political will of the government. While conforming to the 1994 Marakesh agreement and recasting the domestic patent law in line with the international patent regime, there is some room for manoeuvre by making skilful use of some of the articles of the agreement. Virtually all patent laws exclude mere ideas or theories; patents are intended to apply to the embodiment of those ideas. The national laws can be so drafted that the flow of ideas is not obstructed [Lesser 1991:28].

Further, under Articles 27.2 and 27.3 of the Marakesh agreement, the countries may deny patent protection for reasons of public order, morality or for protecting human, animal or plant life or for protecting environment. Protection can be denied for certain inventions such as those which involve "diagnostic, therapeutic and surgical methods for the treatment of humans and animals, and plants and animals (other than micro-organisms) and biological processes (other than micro-biological processes) for their production" [UNCTAD 1994:189; Schott 1994:118]. Reference to public order and morality virtually permits the member countries to do what they had been doing already, as being acceptable to public morality. 'Immorality' can mean things like obscenity, blasphemy, breach of peace and immoral activities, while the French counterpart of 'public order', 'ordre public' is closer to 'public policy' than to 'public order' [Armitage and Davis 1994:16-18]. The UK used this provision to refuse a patent on contraceptive device twice [Armitage and Davis 1994:29-30]. Until now there has been a tendency on the part of the Indian government to go overboard in their enthusiasm in implementing the Marakesh agreement, e g, on subsidy withdrawal. This tendency has to be reversed.

Under the Marakesh agreement, article 27(3)(b) of the TRIPs agreement was to come for review in 1999. Now that review has been postponed till April 2000. Still it is only about a year away. This review will give the less developed countries the opportunity to rectify at least a part of th injustice done to them during the Dunke negotiations of 1991-93 and the Marakesl agreement of April 1994, and to create momentum for further and more drasti changes in their favour in the future years The bargaining power of the poor coun tries, following the disintegration of th Soviet Union, was at its lowest when th Dunkel negotiations were going on an the third world countries including Indi played virtually no role in pushing thei own interests. Whatever negotiation wa conducted was between Europe and th US, with Japan also playing a vital role Among the third world countries only th east Asian ones – South Korea, Taiwan Hong Kong and Singapore – were con sulted some times, but not India or othe countries. The Marakesh agreement wa imposed on them as a *fait accompli*. B now, in 1999, the world environment ha changed, and the south-east Asian crisi has exposed the hollowness of the theol ogy of the unholy trinity of World Bank IMF and WTO. There is now a greate understanding of the harmful implication of Marakesh and WTO among the thir world countries.

What can India do to rectify the injustic of 1994-95? The answer is that India alon can do little. In world trade negotiations more than the number of countries o either side of the argument, what count is the share of a country in world trade India's share is between 0.5 per cent an 0.6 per cent. At the time of independenc it was 2.7 per cent, that is five times more The long reign of the Congress govern ments over the last half-century has suc cessfully brought down India's share t this shamefully low figure. But while Indi alone can do very little, it can combin with others to do a lot. Rather than bein browbeaten by the US and WTO an folding our knees, the time available no should be used to mobilise opinion amon the third world countries so that the TRIP review of 2000 AD becomes favourabl to the poor countries. India has to play leadership role, a role that India playe under Nehru in the 1950s, and one tha small countries like Sri Lanka o Bangladesh cannot play. Pending tha review, India should not give in on crucial matter like the two WTO pre conditions on EMR and Mailbox, tha will weaken our resolve and bargainin power.

The very first step should be to form South Asian Common Market or Fre Trade Association (SAFTA). During th United Front regime these countries agree to make SAFTA operational by the yea

2000 AD, and a great deal of progress was achieved in terms of identifying complimentary trade possibilities. A major fall out of the mushrooming nuclear cloud of Pokhran has been to undermine the efforts of the United Front government led by Inder Kumar Gujral, both as foreign minister and as prime minister, to build bridges with India's neighbours, leading to the establishment of a South Asian Common Market by 2000 AD. The trust needed for such economic co-operation has virtually disappeared since. Still, there can be no retreat from such a goal. Such customs unions or trade blocks allow, even within the framework of WTO, trade concessions to block members that are not otherwise available. Such advantages are taken by the developed countries that have formed their own trade blocks – such as European Union or North Atlantic Free Trade Association (NAFTA).

There are also similar trade blocks among third world countries, e g, ASEAN of south-east Asian countries, Andean Pact of some Latin American countries, Central American Common Market (CACM), Caricom (Caribbean Community), Mercosur (Mercado Caomu del Sur), and, in Africa, Preferential Trade Area for eastern and southern Africa (PTA), Union Douaniere et Economique de l'Afrique Centrale (UDEAC), and west African states. There is no reason why we should not do what others are doing already, by taking the leadership in forming a trade block of south Asian countries. Once such a block is formed, it will be easier to negotiate with ASEAN, Andean Pact or the Organisation of African Unity (OAU) for forming a bigger trade alliance. Negotiations can also be initiated within fora like G-15, G-77, and with countries like China, Brazil and Russia, as well as the European ones such as Italy, Belgium, Denmark and Holland, to create a new international climate to amend, if not to eliminate entirely, injustice done to the poor countries by way of 1994, Marakesh agreement [Dasgupta 1998:164-65].

Price and Non-Price Determinants of Rural Poverty

V N Misra

I
Introduction

IT is argued here that the impact of relative prices on rural poverty became non-significant in the recent article by B M Desai and N V Namboodiri (hereafter as DN) (1998b) probably because it is being included in the equation along with the consumer price index numbers of agricultural labours (CPIAL) measuring thereby the inflation in explaining the changes in rural poverty during the period 1961-62 to 1993-94. Similarly, the explanation for significantly negative coefficient for the distribution in ownership of landholdings is rather misplaced, because it did not change during the last two decades. It seems to have been influenced by other factors included in the equation. Further, it is difficult to rely on the ranking among variables based on standardised coefficients due to the non-inclusion of the most important variable like real agricultural wages capturing the impact of rural labour market on rural poverty in the explanatory framework. As a result, the various trade-offs regarding policy issues based on the coefficients are likely to change if the real agricultural wage is included in the equation. Therefore, for various policy issues, the study of DN is much to be desired. The rationale for these comments would be evident from the following discussions on their findings.

II
Comments on Some Findings

(a) *Relative Prices and Inflation*

The impact of relative prices on rural poverty has been debated quite intensively due to the variance in the findings of the various studies. Ahluwalia (1985) had expressed his reservations about the positive coefficient for the CPIAL in Narain's equation as reported by G M Desai (1985) as a measure of inflation to explain the changes in rural poverty during 1956-57 to 1970-71 on the ground that it indicates the level of prices, whereas it should be relative prices. This has been measured by Ahluwalia as the ratio of CPIAL (representing the prices paid by the rural poor) with that of the national accounts deflator of agricultural gross domestic product (GDP), indicating thereby the prices received by the rural poor. However, the impact of relative prices and CPIAL both turned out to be non-significant in explaining the change in rural poverty during the period: 1956-57 to 1977-78 [Ahluwalia 1985].

Following the methodology of Ahluwalia, DN have also used the same measures of relative prices and inflation (i e, CPIAL). In their case too, the coefficients for these price variables turned out to be non-significant in explaining the changes in rural poverty during 1961-62 to 1993-94 with sign of the coefficients contrary to general expectation. The main difference between Ahluwalia and DN is that Ahluwalia used either relative prices or CPIAL in explaining rural poverty in different equations. However, CPIAL and GDP deflator (but not the relative prices) have also been taken simultaneously by Ahluwalia because they represent altogether different forces: the former for prices paid and the latter for prices received by the rural poor. Therefore, including both these measures simultaneously in an equation was justified. Whereas DN have taken both CPIAL and relative prices (ratio between CPIAL and NDP deflator) simultaneously in explaining rural poverty without realising that CPIAL in this case is entering again in estimating relative prices in their equation. This seems to have created a problem regarding the sign of the coefficients, which turned out to be contrary to general expectation. In the case of Ahluwalia the sign of the coefficient was on expected lines probably because in his equation CPIAL and GDP deflator were representing different forces as mentioned earlier. In the case of DN it is a wrong sign for the price variables rather than their magnitude and significance, which have created the suspicion that the inclusion of CPIAL along with the relative prices (which have also been measured through CPIAL) in the equation, seem to have become responsible to some extent in making the coefficients non-significant with the wrong sign.

It may, however, be noted that with a slight change in the measure of relative prices, i e, dividing the index of food price of CPIAL by state domestic product (SDP) and SDP deflator as index of inflation, Sen (1996) got significantly positive coefficients even by including both the variables simultaneously in the equation, although estimated by pooling time series and cross-section across states. It is, therefore, contended that if DN had slightly modified their measures for price variables or had taken only one price variable at a time in the equation (as has been the case with Ahluwalia's equation), they would have also probably got significantly positive coefficient for relative prices as expected in explaining the changes in rural poverty over the period. It is rather well known that in empirical research, one has to try several combinations to get results which capture the ground situation and are in conformity with general expectation.

The most interesting aspect, however, is that the findings/observations of other studies, which are inconvenient to the arguments and findings of DN, are completely ignored. For instance, the positive coefficients for terms of trade [Misra and Hazell 1996] and relative prices and inflation [Bhattacharya et al 1991], Datta and Ravallion (1996), Sen (1996) for explaining changes in rural poverty have not even been mentioned by DN, to say nothing of making an effort to examine why their coefficients turned out to be contrary to others.

(b) *Distribution of Landholdings*

Two things may be noted at the outset for a proper understanding of the implications of their findings regarding the distribution of holdings in explaining changes in rural poverty over the period. These are: (i) the estimates for the distribution of holdings are available only at four points of time – 1961-62, 1971-72, 1981-82 and 1991-92 and for the remaining years they are interpolated. Such a wholesale interpolation has been justified on the ground of structural variable; and (ii) the real sources for the estimates for Gini coefficient for operational holdings are not given. The studies of Thorat (1997) and Sharma (1997) referred to as sources have not examined the changes in operational holdings. Both the studies have examined only the changes in ownership holdings.

Now let us see the trends in the Gini coefficients for the distribution of landholdings over the period. The inequality in the distribution of ownership holdings as indicated by the Gini coefficient in-

creased from 0.583 in 1961-62 to 0.709 in 1971-72 (see Table). Thereafter, it remained at 0.71 during the 70s and the 80s. This indicates that the distribution of ownership holdings has not shown any change in most of the years of the study. Once the Gini coefficients ranging from 0.709 in 1971-72 to 0.712 in 1991-92 are interpolated for 23 years out of 33 years of analysis by DN (due to non-availability of degrees of freedom in Table 3, it has been presumed that they have interpolated the estimates of rural poverty too), it became almost a constant rather than a variable. In such a situation, can anyone draw worthwhile inference/conclusion about its role in influencing rural poverty, which increased from 47 per cent in 1961-62 to 55 per cent in 1971-72 and thereafter decreased to 39 per cent in 1993-94. It seems that distribution of ownership has not played any role in influencing rural poverty. On the basis of such trends, an inference about either negative or positive impact on the rural poverty is difficult to draw. Its role seems to be at best neutral in the process of reducing rural poverty.

Once these interpolated estimates of the Gini coefficient of distribution of ownership holdings are fed in the regression equation along with other variables, the significantly negative coefficient for distribution of holdings in explaining rural poverty over the period has emerged, probably because other variables seem to have influenced it. Otherwise, such a consistency in the distribution of ownership holdings on its own should not have yielded a significantly negative coefficient. Now the question is to what extent are DN justified in arguing that this negative coefficient has been found because the big farmers with owned land practise labour intensive agriculture with large income multipliers that benefit the rural poor. But the fact is that in this negative relationship, other factors included in the equation seem to have played an important role, which have not been even mentioned by DN in explaining the changes in rural poverty over the period. Therefore, the arguments regarding inequality in distribution of ownership holdings in explaining the changes in rural poverty are invalid due to its stagnant trend during the period of study.

However, in the case of operational holdings, the situation is different in the sense that the inequality in its distribution remained stagnant as indicated by the Gini coefficient at 0.58 each in 1961-62 and 1971-72. After that, it started rising and the coefficient reached 0.64 in 1991-92. Despite the rising trend in the inequality in operational holdings against decreasing trend in rural poverty, it resulted in significantly positive coefficient, probably because of other variables. Therefore, their explanation that large tenant farmers do not provide labour augmenting agriculture and hence, the positive coefficient for inequality in operational holdings in explaining rural poverty is not convincing.

The main force behind increasing inequality in the distribution of operational holdings seems to be technology. What seems to have happened is that when the technology increased profitability of agriculture big farmers started taking land on lease for cultivation.. Due to increasing cost of cultivation, the small farmers have also started leasing out their land to big farmers [Government of India 1997]. This has resulted in increased inequality in the distribution of operational holdings over this period. On the other hand, technology has helped in increasing total factor productivity. Since total factor productivity and inequality in the distribution of operational holdings are moving in the same direction (multicollinearity problem), the effect of the latter seems to have offset by the former in explaining rural poverty. This is all the more evident in the equation of DN for the period 1961-62 to 1993-94, in which the distribution of operational holdings turned out to be non-significant in explaining rural poverty in the country.

If the changes in distribution of ownership holdings had not been included in the regression equation for the reasons mentioned above, the coefficient for operational holdings along with total factor productivity would have captured more appropriately the prevailing situation of tenancy/lease market in the country. This would have provided better understanding of policy issues concerning agrarian reforms which need to be studied afresh in the context of structural adjustment and globalisation of the economy.

(c) *Agricultural Growth vis-a-vis Government Expenditure*

Despite significant negative coefficient for government expenditure on poverty programmes in explaining rural pove :y, DN have inferred on the basis of standardised regression coefficients that for reducing rural poverty, technology-led agricultural growth is far more important than government expenditure on poverty alleviation programmes. This inference requires much more thorough analysis, free from the multicollinearity problem found in their analysis.

(1) Several variables included in the equation like per capita real agricultural net domestic product, total factor productivity, real government expenditure seem to be mutually correlated. As a result, the effect of a particular variable might get reflected in some other variables. The degrees of freedom are also low in their time series analysis.

(2) It is because of these reasons, that the time series and cross-section data across the states are pooled by Sen (1996) for estimating an equation in which rural poverty was regressed against agricultural output per rural person, per capita state domestic product, relative food prices, inflation, and per capita real state development expenditure. In this exercise, the real state development expenditure turned out to be the most important variable in explaining rural poverty over the period followed by agricultural output. The former, unlike the latter which reduced poverty by increasing mean consumption, is the most significant because it reduced poverty by improving both mean consumption and income distribution. It has, however, been concluded by Sen that "the importance of state expenditure and of the relative prices appear to be fairly robust as factors explaining poverty both across time and space".

(3) It may also be argued that both agricultural and non-agricultural outputs are influenced to some extent by government expenditure on poverty alleviation programmes by creating physical infrastructure and raising the demand for products by the rural poor by providing work opportunities and thereby generating income.

(4) It has also not been specified by DN whether government expenditure on various poverty alleviation programmes includes expenditure by state governments. This is important because the state governments are also spending on rural development programmes. Its inclusion in government expenditure may influence the co-

TABLE: DISTRIBUTION OF LANDHOLDINGS AND RURAL POVERTY

Year	Gini Coefficient: Ownership Holdings	Gini Coefficient: Operational Holdings	Incidence of Rural Poverty** (Per Cent)
1953-54	0.751*	0.683*	61.29
1961-62	0.583	0.583*	47.20
1971-72	0.709	0.586	54.84 (1970-71)
1981-82	0.712	0.629	45.31 (1983)
1991-92	0.710	0.640	38.74 (1993-94)

efficient in explaining the changes in rural poverty over the period.

(d) *Omission of Rural Labour Market*

It is rather well known that the rural labour market transmits the benefits of not only technological development in agriculture but also of employment generated by the government for the rural poor. Keeping this in view, the real agricultural wages capturing the influence of rural labour market are taken into account in explaining the changes in rural poverty in most of the studies. This important variable has, however, been ignored by DN, probably because they thought that total factor productivity in agriculture and government expenditure would reflect the influence of rural labour market on poverty. What seems to have been missed is that both these factors, particularly government expenditure, are influencing rural poverty by raising employment and hence, wages. It is, therefore, contended that if DN had included real agricultural wages in the explanatory framework, the ranking of the variables based on the coefficients would have certainly changed and so also their prioritisation of various policy issues.

III
Concluding Observation

In order to draw inferences about the trade-offs between various policy issues, analysis must incorporate all the important variables interlinkages among variables and the routes through which they influence rural poverty. On this count the analysis of DN leaves much to be desired, as is evident from the omission of real agricultural wage capturing the impact of rural market on the rural poverty.

A structural variable like distribution of landholdings in explaining changes in rural poverty can be examined more appropriately by pooling time series and corss-section data across states. It reduces the multicollinearity problem and provides enough degrees of freedom. Therefore, one may rely more on such estimates than on those based on time series analysis with limited number of observations as has been the case with the analytical framework of DN.

The Gini coefficient indicating inequality in the distribution of landholdings being the relative measure of structural variable, its impact would have been captured more appropriately by estimating its relationships with relative rural poverty, i e, inequality in per capita consumption rather than absolute rural poverty as has been attempted by DN. This would have helped in drawing more sharply policy issues regarding agrarian reforms which have a bearing on rural poverty in the country.

Even after getting the non-significant coefficients for price variables with the wrong sign, DN have not bothered to identify the factors responsible for it, with a view to change their specification of the variables, so that it may provide the results on expected lines and in broad agreement with others' findings to the extent possible. Perhaps they want to be consistent with earlier findings in which the relative prices measured in inter-sectoral framework turned out to be significantly negative in explaining the changes in marketed surplus and total factor productivity in agriculture [DN 1997a and 1998a]. It has now become rather well known that in the framework of DN, the relative prices have either no role to play, as is the case with rural poverty or negative one, as is evident from their earlier analysis of marketed surplus and total factor productivity in agriculture.

The findings of DN regarding relative prices seem to suggest that since there is no role of relative prices in raising either total factor productivity or marketed surplus, there is no need of agricultural price policies either. Now, relative prices and inflation also do not seem to harm the rural poor, if one stretches the findings of DN to their logical conclusion.
